THE TERRITORIES DEALT WITH IN THIS FLORA

INTRODUCTION

Volume 16, part 1 is the fourth part of the Flora of Southern Africa to be published, the three which have already appeared being Vol. 1 (1966), Vol. 26 (1963) and Vol. 13 (1970).

For a key to the families, the Flora should be used in conjunction with Phillips's Genera of South African Flowering Plants, which is arranged on the lines of the Engler system. The genera are numbered according to the list published by De Dalla Torre and Harms in order to facilitate reference, though genera in the Flora are not necessarily arranged in this sequence.

As in previous volumes, generally accepted abbreviations are used for literature references, except in the following cases which appear frequently and are, therefore, considerably condensed:

C.F.A	Conspectus	Florae Angolensis.
C.I/1	Conspectus	I lorac Angolensis.

F.	C								Flora Capensis.

As before, the abbreviation "l.c." is used for previously cited references even though "op. cit." or "tom. cit." would in certain cases be more correct.

In citing specimens the grid reference system has been used. The spelling of the names of some localities has been brought into line with the findings of the Committee on Standardisation of Place Names.

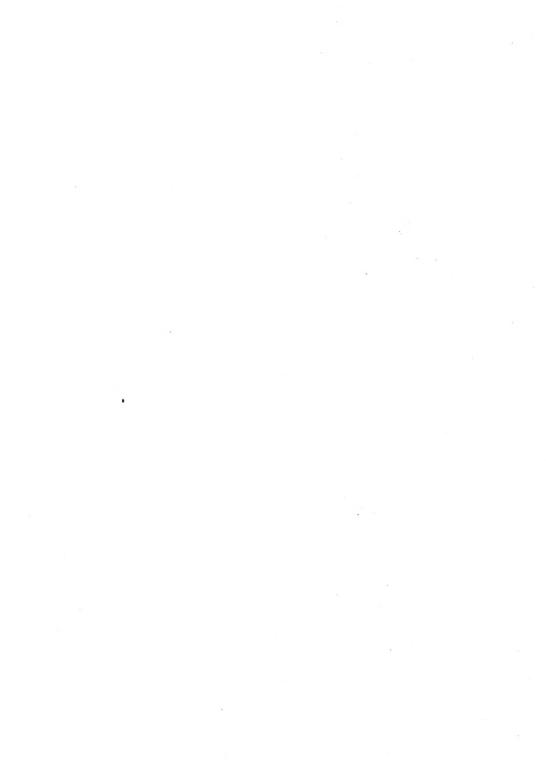

In the text, species which show evidence of becoming naturalized are treated in the same way as indigenous species. In the Index, synonyms are in italics while exotic species are signified by an asterisk*.

PLAN OF CONTENTS OF VOLUMES

FABACEAE

(alternative name Leguminosae)

Trees, shrubs, climbers or herbs. Leaves nearly always alternate, often pinnate or pinnately 3-foliolate, less often bipinnate or digitately 3-foliolate, occasionally 1-foliolate, simple or digitate*; stipules usually present. Receptacle usually expanded, flat or saucer- or cupshaped, occasionally tubular or not expanded. Sepals usually united. Petals usually 5, occasionally fewer or absent, usually free, less often some or rarely all united. Stamens inserted with the petals at the rim of the receptacle, usually 10 but sometimes fewer or more. Ovary almost always a single superior 2-several-ovulate carpel, rarely 1-ovulate, the ovules attached to the adaxial suture. Fruit nearly always a dry legume (pod), usually dehiscing into 2 valves, less often dehiscing only along the upper suture or splitting transversely into 1-seeded segments or, indehiscent. Seed without, or with very little, endosperm.

Key to Subfamilies

- Flowers regular, the petals valvate in the bud, often united basally; sepals usually united basally; stamens as many as the petals or twice as many or numerous, free or all united into a tube or to the base of the petals; leaves bipinnate or, rarely, pinnate in indigenous species*; seeds normally with an areole on each face or side...........Mimosoideae
- Flowers nearly always zygomorphic; petals imbricate in the bud, free or some of them united; seeds usually without an areole:

A cosmopolitan family of about 690 genera and 18 000 species, many of which are of great economic significance.

^{*} Some exotic species of Acacia grown in our area have phyllodes which may appear to be simple leaves.

Subfamily 1. MIMOSOIDEAE

DC., Prodr. 2: 424 (1825), as suborder or tribe *Mimoseae*; Benth. in Hook., J. Bot. 3: 133 (1841), in Trans. Linn. Soc. Lond. 30: 335 (1875).

by J. H. ROSS

Trees, shrubs or rarely herbs, often armed with prickles or spines. Leaves bipinnate or (in exotic species only) simply pinnate or modified to phyllodes. Stipules present, sometimes spinescent. Inflorescences usually spikes, racemes or heads of sessile or shortly pedicellate, usually small or very small, regular, (3)5(6)-merous flowers. Sepals with valvate or rarely imbricate aestivation, often open from an early stage of bud, usually united to form a toothed or lobed calyx, rarely free. Petals valvate in bud, free or more often united below into a tube. Stamens 4–10 (as many as or twice as many as the petals) or indefinite, free or adnate below to the corolla, or the filaments united below into a tube, usually ±exserted; anthers small, versatile, sometimes with an apical gland; pollen-grains sometimes simple but frequently compound or united. Pods and seeds various, the latter usually marked with areoles*; radicle of embryo in seed usually straight.

Genera 56, with about 2 800 species, mainly tropical and subtropical, especially numerous in the southern hemisphere. 13 genera and 106 species occur in our area.

The genera in our area are grouped under a number of tribes. The sequence of the genera, and consequently of the tribes, follows the numerical order adopted by de Dalla Torre and Harms in their Genera Siphonogamarum (1900–1907). A conspectus of the tribes is given below:—

1. Tribe Ingeae Benth. in Trans. Linn. Soc. Lond. 30: 359 (1875). Calyx-lobes valvate; stamen-filaments more or less united into a tube; stamens numerous (more than 10); pollen-grains usually collected into 2-6 masses in each loculus. Genus 1.

2. Tribe Acacieae *Benth.* in Hook., Lond. J. Bot. 1:318 (1842); Benth. in Trans. Linn. Soc. Lond. 30:359 (1875). Calyx-lobes valvate; stamen-filaments free from one another or united basally only; stamens numerous (more than 10); pollen-grains usually collected into 2-6 masses in each loculus. Genus 2.

3. Tribe Mimoseae Bronn, De Formis Pl. Legum. 130 (1822); Benth. in Hook., J. Bot. 2: 127 (1840); (Eumi-moseae Benth. in Trans. Linn. Soc. Lond. 30: 359, 1875). Calyx-lobes valvate; stamen-filaments free from one another or united basally only; stamens 10 or fewer; anthers without a gland at the apex; pollen-grains numerous and separate in each loculus. Genera 3-5.

4. Tribe Adenanthereae *Benth*. in Trans. Linn. Soc. Lond. 30: 358 (1875). Calyx-lobes valvate; stamenfilaments free from one another or united basally only; stamens 10 or fewer; anthers with a (sometimes deciduous) gland at the apex; pollen-grains numerous and separate in each loculus. Genera 6-13.

It is often difficult to identify some of the genera of this subfamily without complete material, including flowers and fruits. As either flowers or fruits are frequently absent, two alternative keys have been constructed, one for flowering and the other for fruiting specimens.

Key to genera based on vegetative and floral characters

Plant armed with prickles or spines:

Inflorescence bicoloured, the upper part yellow, the lower mauve, pink or white; short lateral branchlets terminating in spines, plants otherwise unarmed....7. Dichrostachys

^{*} The seeds of nearly all Mimosoideae show on each face an area, usually circular to elliptic or oblong in shape, bounded (except usually for a gap opposite the micropyle) by a fine line which frequently appears as a fissure in the testa. The size and shape of this area are often taxonomically important, and I have followed Brenan in F.T.E.A. Legum.—Mimos.: 1 (1959) in employing the term "areole" to refer to it. It corresponds to the term "pleurogram" as used by Corner in Phytomorphology 1:117-150 (1951).

The seeds of nearly all our Mimosoideae show these areoles. They appear to be absent only in *Elephantorrhiza*, *Newtonia* and the giant *Entada* species.

While areoles are of common occurrence in Mimosoideae, they do not seem to occur in the other subfamilies of Leguminosae, except in a few genera of Caesalpinioideae, namely, *Burkea*, *Tamarindus* and in a rather modified way in some species of *Caesal*.

Mimosoideae 3

Inflorescence concolorous; plants armed with recurved prickles or stipular spines, very rarely short lateral branchlets terminating in spines:
Plant armed with recurved prickles or stipular spines, spine-tipped lateral branchlets absent:
Flowers in globose or subglobose heads, very rarely the inflorescence reduced to only 2-4 flowers per "head":
Stamens as many as or twice as many as the (3)4-5(6) corolla-lobes:
Small rigid much branched shrub with pale green to olive, cano-puberulous, substriate branches; stipules spinescent, recurved, up to 3,5 mm long; leaves small, each with 1 pinna pair; stamens 10, the 5 opposite the petals shorter than those alternating with the petals; anthers with a minute deciduous apical gland
Annual or perennial herb or small shrub; stems armed with scattered prickles and usually densely hispid or setulose; stipules not spinescent, persistent; leaves sensitive to touch, with (1)2-14 pinnae pairs; stamens 4 or 8; anthers eglandular apically; flowers pink or mauve4. Mimosa
Stamens numerous (± 35-200); flowers mostly white, yellowish-white or deep yellow
Stamens 10; recurved prickles scattered along the stem; leaflets 2,5-9 mm wide
Stamens numerous (\pm 35-200); prickles or stipular spines usually confined to the nodes and in pairs, sometimes solitary or in threes at the nodes, seldom prickles scattered but then leaflets less than 1,75 mm wide2. Acacia
Plant armed with spine-tipped lateral shoots, recurved prickles and stipular spines absent; inflorescence globose; stamen-filaments united basally into a tube 1. Albizia
Plant unarmed:
Inflorescence capitate, globose or subglobose:
Aquatic herb with creeping, usually floating and swollen stems; flowers of two sorts, hermaphrodite in upper part of head, neuter with elongate staminodes in lower part
Trees, shrubs or suffrutices, rarely herbaceous and then not aquatic:
Leaves reduced to simple entire phyllodes
Leaves bipinnate:
Stamens 10:
Leaves with 1 pinna pair; leaflets large, 2-6 cm wide; large trees up to 15 m high11. Xylia
Leaves with (2)3-8 pinnae pairs; leaflets small, less than 0,5 cm wide; perennial herb, suffrutex, shrub or small tree:
Anthers with conspicuous scattered hairs; flowers in heads up to 1,8 cm in diameter; shrub or small tree with densely grey-puberulous branchlets; leaflets 1,5-4 mm wide
Anthers glabrous; flowers in heads up to 0,8 cm in diameter; perennial herb or suffrutex with subglabrous to sparingly puberulous ± angular stems; leaflets 0,8-1,5 mm wide
Stamens many to numerous (± 19-200):
Stamen-filaments free; central flower of inflorescence not different from the rest

Stamen-filaments united basally into a tube, tube included or exserted beyond the corolla; central flower of inflorescence usually differing from and often larger than the rest
Inflorescence elongate, spicate or racemose:
Leaflets alternate to subopposite, 0,7-1,9 cm wide, with petiolules 1,5-3 mm long
Leaflets opposite, very rarely alternate but then sessile and less than 2 mm wide: Stamens 10:
Leaf-rhachis with a gland at the junction of each pair of pinnae or the upper pairs; large tree
Leaf-rhachis eglandular; liane, climber, scandent shrub, suffrutex or small tree:
Liane, climber, scandent shrub or erect suffrutex, the latter with leaflets 7-20 mm wide
Suffrutex, shrub or small tree, leaflets less than 6,5 mm wide12. Elephantorrhiza Stamens many to numerous (± 19-200):
Stamen-filaments free
Stamen-filaments united basally into a tube, tube included or exserted beyond the corolla
Key to genera based on vegetative and pod characters
Plant armed with prickles or spines:
Pod at maturity splitting transversely into segments each containing a seed:
Valves of pod falling away at maturity, leaving the persistent margins; stem and often leaves with scattered prickles:
Pod without bristles or prickles on the surface or margins (very rarely a few prickles occur along one margin), 2,8-4 cm wide; leaflets 2,5-9 mm wide; climber or scandent shrub
Pod±bristly or prickly on the surface or on the margins only, up to 1,2 cm wide; leaflets up to 3 mm wide; annual or perennial herb or small shrub4. Mimosa Valves of pod not falling away from the margins; stems armed with paired stipular
spines
Pod not splitting transversely into segments:
Plant armed with stipular spines or with recurved prickles; spine-tipped lateral branchlets absent:
Pod indehiscent, broadly falcate-ovate to semi-orbicular, up to ± 1,5 cm long and 1,5 cm broad, compressed, the lower suture arched and winged; small rigid much branched shrub with pale green to olive, cano-puberulous, substriate branches; armed with paired, short, recurved stipular spines; leaves small, each with 1 pinna pair
Pod dehiscent or indehiscent, if indehiscent then not as above; small shrubs to large trees; armed with paired stipular spines or with prickles which are in pairs, solitary or in threes at the nodes, or scattered along the stem; leaves with 1-60 pinnae pairs
Plant armed with spine-tipped lateral shoots; recurved prickles and stipular spines absent:
Pods densely clustered, usually contorted or spirally twisted; leaflets less than 3 mm wide

MIMOSOIDEAE 5

Pods not densely clustered, ±straight or slightly curved, not contorted or twisted; leaflets more than 3 mm wide
Plant unarmed (except for a single minute very inconspicuous prickle below the node which is sometimes present in Albizia harveyi):
Aquatic herb with creeping, usually floating and swollen stems; pods clustered, bent almost at right angles to the short basal stipe, 1,3-2,8 cm long6. Neptunia
Trees, shrubs or suffrutices, rarely herbaceous and then not aquatic; pods usually longer than 3,5 cm:
Leaves reduced to simple entire phyllodes
Leaflets alternate to subopposite, distinctly petiolulate; pod bluntly tetragonal or subcylindric in section, woody, indehiscent9. Amblygonocarpus
Leaflets opposite, very rarely alternate but then sessile and very narrow; pod usually flattened, rarely±turgid, never tetragonal:
Pod at maturity splitting transversely into segments each containing a seed
Pod not splitting transversely into segments:
Valves of pod woody, separating along both margins, recurving; leaves with only 1 pinna pair11. Xylia
Valves of pod membranous to rigidly coriaceous but not woody or recurving:
Pod dehiscent:
Valves of pod separating along one margin only:
Pod 0,3-1(1,3) cm wide, usually ±moniliform; seeds small, black to brown, unwinged
Pod 1,3-2 cm wide, margins entire, bright red when young becoming brown with age; seeds large, brown, conspicuously winged
Valves of pod separating along both margins:
Pod up to 4 mm wide; perennial herb or small suffrutex5. Desmanthus Pod over 1 cm wide, shrub or tree:
Seeds 6-13 mm wide; leaflets variable, often exceeding 4 mm in width; large shrub or tree; widespread
Seeds 3,5-5 mm wide; leaflets up to 4 mm wide; shrub or small tree to 4 m high, naturalized exotic confined to Natal coast3. Leucaena
Pod indehiscent:
Valves at maturity separating from the persistent margins, the outer layer often peeling off the inner layer, the layers remaining intact or breaking up irregularly; suffrutex, shrub or small tree12. Elephantorrhiza
Valves not separating from the margins and splitting into layers; large shrub or tree
Conspectus of the pod differences

In all genera except Acacia the pod is usually rather constant in form and structure.

1. Pod dehiscing into two separate valves:

Valves woody:
Acacia
Xylia

6 Mimosoideae

Valves papery to rigidly coriaceous:

Acacia Albizia Desmanthus

Leucaena Neptunia

2. Pod dehiscing into two valves which remain attached to one another along one margin:

Acacia Newtonia

3. Pod splitting transversely into segments each containing a seed:

Acacia Entada Mimosa

4. Pod indehiscent, not splitting transversely:

Valves separating from the margins, usually splitting into two layers:

Elephantorrhiza

Valves spiral or contorted, but neither separating from the margins nor splitting:

Acacia Dichrostachys

Valves flattened, but neither spiral nor contorted nor separating from the margins nor splitting:

Acacia Albizia Xerocladia

Valves not flattened but convex or angled, neither spiral nor contorted nor separating from the margins nor splitting:

Acacia Amblygonocarpus

Exotic species

Several exotic species of Mimosoideae are planted in our area and most of them are mentioned under their appropriate genera. In addition to these, however, the genus *Prosopis* occurs only as an exotic and is dealt with briefly below. Some species of *Prosopis* bear a superficial resemblance to certain of the indigenous *Acacia* species but may be readily distinguished from the latter as there are only 10 stamens per flower.

1. Prosopis pubescens *Benth*. in Hook., Lond. J. Bot. 5:82 (1846); Benson in Am. J. Bot. 28:753 (1941); Isely in Madrono 21:294 (1972); in Mem. N.Y. Bot. Gdn. 25 (1):120 (1973).

Large shrub or small tree up to 4 m high armed with paired straight spines 0,5-1,5 cm long. Leaves bipinnate, with 1 pinna pair; leaflets 5-8 pairs per pinna, $5-10\times1,75-4$ mm, finely and rather sparsely appressed-pubescent on both surfaces. Inflorescence an axillary spike; flowers sessile, yellow. Ovary densely pilose. Pod very tightly spirally coiled into a \pm straight, brownish cylinder 2,5-5 cm long overall, 4-6 mm in diameter, tomentellous when young but becoming glabrescent with age.

The Screw-Bean, a native of the Western United States of America, is found in the northern Cape Province. Recorded from Kimberley, Wilman sub KMG 3385, Acocks 50; Carnarvon Distr., along River at Van Wyk's Vlei, Acocks 1788.

MIMOSOIDEAE 7

2. Prosopis velutina *Wooton* in Bull. Torrey Bot. Club 25: 456 (1898); Johnston in Brittonia 14: 86 (1962); Isely in Madrono 21: 295 (1972); Isely in Mem. N.Y. Bot. Gdn. 25 (1): 120 (1973).

Shrub or small tree up to 3 m high armed with paired straight spines 1-2 cm long. Leaves bipinnate; petioles and rhachillae sparingly to densely pubescent; with 1 pinna pair; leaflets 13-20 pairs per pinna, $6-13\times 2-4$ mm, venation usually fairly conspicuous on the lower surface, with marginal cilia. Inflorescence an axillary spike, axes densely pubescent; flowers sessile, yellow. Ovary densely pilose. Pod straight or slightly falcate, 10-20 cm long, 0,8-1 cm wide, somewhat compressed, margin slightly constricted between the seeds, segments oblique, finely longitudinally venose, beaked apically.

The Velvet Mesquite, a native of the Western United States of America. Recorded from the Cape Province: Kenhardt Distr., near Putsonderwater on Marydale-Upington Road,

Merxmuller 728; Hay Distr., Witsand, Acocks 2287.

3. **Prosopis glandulosa** Torrey in Ann. Lyc. N.Y. 2:192 (1827); Johnston in Brittonia 14:82 (1962); Isely in Madrono 21:290 (1972); in Mem. N.Y. Bot. Gdn. 25 (1):118 (1973).

P. juliflora auct., non (Swartz) DC. P. chilensis auct., non (Mol.) Stuntz

Shrub or tree to 10 m high armed at the nodes with paired or solitary straight spines 0,5-3 cm long. Leaves bipinnate; with 1-2 pinnae pairs; leaflets 7-22 pairs per pinna, 1-6 cm long, 1-4 mm wide, widely spaced on the rhachilla, the intervals wider than the width of the leaflets, venation fairly conspicuous, glabrous. Inflorescence an axillary spike; flowers sessile, yellow. Ovary densely pilose. Pod straight or almost so, 10-22 cm long, \pm 8 mm in diameter, margins not or scarcely constricted, valves becoming woody, with a fibrous exocarp, beaked apically.

P. glandulosa, the Mesquite, is one of the most successful and characteristic plants of the southwestern United States of America. P. glandulosa forms part of a complex of closely related and taxonomically difficult species (see M. C. Johnston in Brittonia 14: 72-90, 1962). Leaflet size, shape and number in P. glandulosa are extremely variable and two varieties are recognized chiefly on the basis of leaflet size, namely, var. glandulosa with leaflets 2,5-6 cm long and var. torreyana (Benson) M. C. Johnston with leaflets 1-2,5 cm long. The latter occurs in our area.

Recorded from South West Africa, without precise locality, Cellier sub PRE 1603; Transvaal, Wolmaransstad, Liebenberg 3422.

3443 1. ALBIZIA

Albizia Durazz., Magazz. Tosc. 3(4) (vol. 12): 10, 13, illustr. (1772)*; Benth. in Hook., Lond. J. Bot. 3: 84 (1844); Harv. in F.C. 2: 284 (1862); Benth. & Hook.f., Gen. Pl. 1: 596 (1865); Harv., Gen. Pl. ed.2: 92 (1868); Oliv. in F.T.A. 2: 355 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 557 (1875); Taub. in Pflanzenfam. 3, 3: 106 (1891); Sim, For. Fl. ^{*}I have not seen this work. The reference is from Little in Amer. Midl. Nat. 33:510 (1945).

8 Mimosoideae

Trees or shrubs, very rarely climbing (not in Africa); prickles or stipular spines absent in African species (except for a very small prickle beneath the node in A. harveyi sometimes, while in A. anthelmintica some branchlets are sharp and spinescent apically). Leaves bipinnate; petiole usually glandular; pinnae each with one to many pairs of leaflets. Stipules herbaceous, usually soon deciduous. Inflorescences globose or (not in indigenous African species) spicate, pedunculate, axillary and solitary or more often fascicled, often aggregated near the ends of the branchlets which may be lateral and much shortened, sometimes paniculate. Flowers hermaphrodite or occasionally male and hermaphrodite; 1–2 central flowers in each head frequently larger, different in form from the others and apparently male. Calyx gamosepalous, normally with 5 teeth or lobes (rarely 4, 6 or 7). Corolla gamopetalous, infundibuliform or campanulate, normally with 5 lobes (rarely 4 or 6). Stamens numerous (19–50), fertile, their filaments united basally into a slender tube, tube shorter than or exceeding the corolla. Ovary subsessile or shortly stipitate. Pods oblong, straight, flattened, dehiscent or not, not septate within, the valves papery to rigidly coriaceous. Seeds usually ±flattened.

A genus of 100-150 species occurring throughout the tropics, with fewer in the subtropics. 11 indigenous species occur in our area, while 3 introduced species have become naturalized. A. chinensis (Osbeck) Merr. is cultivated in the Transvaal but does not appear to have become naturalized yet.

The generic name was previously often spelt Albizzia; the reasons for rejecting this spelling are given by Little in Amer. Midl. Nat. 33: 510 (1945).

The genus Albizia is named in honour of Filippo del Albizzi, a Florentine nobleman who in 1749 introduced A. julibrissin into cultivation.

In the following key the descriptions of the floral parts do not apply to the 1-2 larger modified flowers usually found in the centre of each of the globose heads; in these the staminal tube is not or scarcely exserted beyond the corolla even when it is long-exserted in the other flowers.

Key based mainly on vegetative and floral characters

Staminal tube not or scarcely exserted beyond the corolla:

Leaflets small or very small, 0,5-4 mm wide:

Calyx and corolla fulvous- to golden-pubescent or tomentose; mature leaves clothed with a grey to golden spreading indumentum; pinnae 2-44 pairs:

Leaflets 0,5-1,5 mm wide; pinnae 2-44 pairs:

Apex of leaflets obtuse or subacute, symmetric, not falcate; lateral nerves of leaflets indistinct beneath; pinnae 12-44 pairs; bracteoles already fallen when flowers open; stamen-filaments 1-1,5 cm long; pods apparently indehiscent, puberulous...2. A. amara subsp. sericocephala

Leaflets 1,5-4 mm wide, apex rounded to subacute or mucronate, turned towards the apex of the pinna, lateral nerves usually ±raised and visible beneath; pinnae 2-7 pairs; pods indehiscent, very prominently transversely venose, the veins ± parallel and 2-4 mm apart.....4. A. forbesii

Leaflets exceeding 4 mm in width:

 Mimosoideae 9

Young branchlets not forming spine-tipped shoots; rhachides and rhachillae not projecting, or else projections ± straight and not hooked (except rarely and casually in A. versicolor) and usually deciduous; calyces and corollas usually ±densely puberulous to tomentose outside, if glabrous or almost so then flowers not precocious:

- Mature leaflets thinly appressed-pubescent or glabrous beneath, in 3-17 pairs; young branchlets not densely rusty-tomentose:

Indumentum on corolla-lobes conspicuously rusty:

Leaflet margins crisped; stamens 1-1,6 cm long; pods 1,4-2,6 cm wide......8. A. suluensis

Leaflet margins not crisped; stamens 1,5-3 cm long; pods 2,5-5 cm wide:

Indumentum on corolla-lobes grey to whitish or lobes glabrous:

Staminal tube exserted beyond the corolla for a length of $\pm 0.7-2.5$ cm (usually more than 1 cm):

Key based on vegetative and fruit characters

Leaflets small or very small, 0,5-4 mm wide:

Mature leaves clothed with a grey to golden spreading indumentum; pinnae 2-44 pairs:

Leaflets 0.5-1.5 mm wide:

Leaflets 1,5-4 nm wide:

- Pinnae 2-7 pairs; leaflets 6-16 pairs per pinna; pods oblong, 3,2-5 cm wide, indehiscent, very prominently transversely venose, the veins \pm parallel and 2-4 mm apart......4. A. forbesii

Leaflets exceeding 4 mm in width:

Young branchlets often forming abbreviated spine-tipped lateral shoots; rhachides and rhachillae of all or most leaves projecting at the ends as a short rigid persistent deflexed hook; a single similarly bent stipel often near the base of each rhachilla; leaflets (1)2-4(6) pairs per pinna......9. A. anthelmintica

- Young branchlets not forming spine-tipped shoots; rhachides and rhachillae not projecting, or else projections \pm straight and not hooked (except rarely and casually in *A. versicolor*) and usually deciduous:

 - Mature leaflets not broadly and obliquely obovate to suborbicular, thinly appressed-pubescent or glabrous beneath, if densely pubescent beneath then smaller than above and usually more numerous; pods glabrous to pubescent, not ± glossy:
 - Bark smooth, creamy-white to ochre-yellow, peeling off in large papery pieces....7. A. tanganyicensis Bark not peeling off in large papery pieces:
 - - Pods 1,4-2 cm wide; young branchlets not densely and coarsely rusty- to fulvous-pubescent; stipules <3 mm wide:
 - Pods 2, 2-4,6 cm wide, if less than 2,2 cm wide then young branchlets densely rusty- to fulvous-pubescent and stipules ovate, $5-12 \times 3-8(11)$ mm:

 - Young branchlets very shortly pubescent, often becoming glabrous with age; pinnae 1-4(5) pairs; leaflets 8-28 mm wide, not as above; stipules much smaller than above; pods 2,5-4,6 cm wide:
- 1. Albizia brevifolia Schinz in Bull. Herb. Boiss., Sér. 2, 2: 945 (1902); Bak.f., Leg. Trop. Afr. 3: 864 (1930); Codd in Bothalia 7: 69 (1958); Von Breitenbach, Indig. Trees S. Afr. 2: 254 (1965); Schreiber in F.S.W.A. 58: 14 (1967); Brenan in F.Z. 3, 1: 125 (1970); Van Wyk, Trees Kruger Nat. Park 1: 112 (1972); Palmer & Pitman, Trees S. Afr. 2: 713 (1973). Type: Mozambique, Boruma, on the Nhasinde, Menyharth 994 (Z, holo.!; K!).
- A. parvifolia Burtt Davy, Fl. Transv. 2: xvii, 348 (1932). Syntypes: Transvaal, Soutpansberg district, near Messina, Rogers 19247a (PRE!); Rogers 22118 (K!). A. rogersi Burtt Davy, Fl. Transv. 2: xviii, 348 (1932); Codd, Trees & Shrubs Kruger Nat. Park 56 (1951); O. B. Miller in J. S. Afr. Bot. 18: 27 (1952); F. White, For. Fl. N. Rhod. 89, fig. 16 I (1962). Type: Transvaal, Soutpansberg district, Messina, Moss & Rogers 66 (PRE holo!; BM!; K!).

Shrub or tree 3–15 m high, trunk often branching near ground level into several to many ascending branches. Bark grey to greyblack, smooth or shallowly fissured; young branchlets very sparingly to \pm densely appressed grey-puberulous when young, becoming glabrous with age; occasionally a few lateral shoots abbreviated and spinescent apically. Leaves sparingly to \pm densely pubescent or glabrous: petiole 0.8-2.5 cm long, adaxial gland squat, sessile, ± 0.25 mm high; rhachis (1)2,5-7(14) cm long; pinnae (3)6-10(15) pairs; rhachillae 1-4,4 (6,5) cm long; leaflets 9-25 pairs, 3-7,5(9) \times 0,75-1,75(2) mm, narrowly oblong to linear-oblong, symmetric, obtuse to subacute apically, not falcate, midrib nearly central (except basally), lateral nerves indistinct beneath, glabrous or margins + appressed-ciliate. Inflorescences

globose; peduncles 1,5-3 cm long, sparingly appressed-pubescent. Flowers white creamy-yellow, on pedicels 1-1,5 mm long; bracteoles rapidly deciduous. Calyx 1-1,5 mm long, glabrous to ± puberulous outside. Corolla 4-5 mm long, tube 2,5-3 mm long, glabrous, lobes 1,5-2 mm long, pubescent apically. Stamens 1-1,8 cm long, united basally for \pm 3 mm, tube not or scarcely exserted beyond the corolla. Ovary + 1.5 mm long, shortly stipitate, glabrous. Pods $(9)12-25 \times (1,8)2,4-4,4$ cm, linear to linearoblong, valves thin, transversely venose, glabrous to finely puberulous, umbonate over the seeds, apparently indehiscent. Seeds $8-10 \times \pm 6.5$ mm, flattened.

Found in South West Africa, Botswana, Rhodesia, Mozambique and the Transvaal. Occurs usually on hot, dry, rocky hillsides, often on granite, quartzite or sandstone formations.

S.W.A.—1720 (Posto Velho): S.E. slope of mountain at Ombepera, De Winter & Leistner 5510. 1813 (Ohopoho): Giraffenbergen bei Otjue, Merxmuller & Giess 1476 (M); 14,4 km W. of Oruwanje, Giess & Leippert 7387 (M). 1814 (Otjitundua): Otjitoko, Merxmuller & Giess 1364 (M).

TRANSVAAL.—2229 (Waterpoort): Dongola area, farm Little Muck, Codd 4459, 2230 (Messina): Messina, Pole Evans 2527. 2231 (Pafuri): Kruger National Park, near Punda Milia, Lamont 5. 2327 (Ellisras): 17,6 km S. of Ellisras, Codd 8493. 2331 (Phalaborwa): Kruger National Park, The Gorge, Codd 6188. 2527 (Rustenburg): 15,4 km N. of Assen, Codd 6566.

Vegetative specimens of A. harveyi Fourn. are sometimes confused with specimens of A. brevifolia but the two species may be distinguished by the shape of the apex of the leaflet which, in A. harveyi, is acute and distinctly falcate, the apex turned towards the pinna-apex, while in A. brevifolia it is obtuse to subacute and almost straight.

2. Albizia amara (Roxb.) Boiv. in Encycl. XIX-me Siècle 2: 34 (?1834); Benth. in Trans. Linn. Soc. Lond. 30: 567 (1875); Brenan in Kew Bull. 10: 189 (1955); in F.T.E.A. Legum.-Mimos.: 151 (1959); in F.Z. 3, 1: 123 (1970). Type: India, Roxburgh (K, painting of holotype material, No. 486!).

Mimosa amara Roxb., Pl. Corom. 2:13, t.122 (1799). Type as above.

Syntypes: Sudan, Sennar, Kotschy 244 (K!; P!) & Kordofan, Milbes, Kotschy 294 (BM!; E!; K!; OXF!; P!; W!); Ethiopia, Gapdia, Schimper 818 (BM!; K!; OXF!; P!) & Dscheladscheranne [Jelajeranne], Schimper 883 (BM!; K!; OXF!; P!).

A. sericocephala Benth. in Hook., Lond. J. Bot. 3:91 (1844); Milne-Redhead in Kew Bull. 1934: 301 (1934); Brenan, Checklist Tang. Terr. 341 (1949); Pardy in Rhod. Agric. J. 49: 14 (1952). Types as above. A. amara sensu Oliv. in F.T.A. 2: 356 (1871); Bak.f., Leg. Trop. Afr. 3: 865 (1930); Gilbert & Boutique in F.C.B. 3: 172 (1952). A. struthiophylla Milne-Redhead in Kew Bull. 1933: 144 (1933); O. B. Miller in J. S.Afr. Bot. 18: 27 (1952) ("struthiofolia"). Type: Zambia, Mazabuka, Milne-Redhead 1207 (K, holo.!, PRE!).

Acacia sericocephala Fenzl in Flora 27: 312 (1844), nomen nudum.

Inga sericocephala A. Rich., Tent. Fl. Abyss. 1:236 (1847). Types as for Albizia sericocephala.

Tree 2-12 m high, crown rounded or somewhat flattened. Bark fissured, rough; young branchlets with rather short dense spreading golden to grey pubescence. Leaves golden-tomentose when young, rusty to grey-pubescent when older: petiole 0,6-1,6 cm long, adaxial gland low, sessile, up to \pm 0,25 mm high; rhachis 5,8-23 cm long; pinnae 12-44 pairs; rhachillae 1-3 cm long; leaflets (12)20-45 pairs, $2-4 \times 0.5-1$ mm, linear to linear-oblong, symmetric, obtuse to subacute apically, not falcate, midrib nearly central (except basally), lateral nerves indistinct beneath, rarely slightly raised, ± appressed-pubescent on one or both surfaces or on the margins only, glabrescent or not later. *Inflorescences* globose; peduncles 1–2,4 cm long, golden-tomentose when young, becoming grevish when older. Flowers whitish or tinged with pink, subsessile, buds goldentomentose; bracteoles rapidly deciduous. Calyx 1-2 mm long, golden-puberulous or pubescent. Corolla 3,5-5 mm long, goldenpuberulous or pubescent, especially towards apices of lobes, lobes 2-2,5 mm long. Stamens 1-1,5 cm long, united basally for \pm 2.5 mm, tube not or scarcely exserted beyond the corolla. Ovary 2-2,5 mm long, shortly stipitate, glabrous. Pods $12-28 \times 2.5-4$ cm, linear-oblong, valves thin, transversely venose, puberulous, umbonate over the seeds, apparently indehiscent. Seeds $8-13 \times 7-8$ mm, flattened.

Found from the Sudan and Ethiopia southwards to Botswana, Rhodesia, Mozambique and the north eastern Transvaal. In the Transvaal it is restricted to the area between Sibasa and Punda Milia where it occurs on sandy flats in woodland and lowveld bush.

TRANSVAAL.—2230 (Messina): Sibasa area, Van Warmelo 5115/24; 27,2 km E. of Sibasa, Codd & Dyer 4494; 38,4 km N.E. of Sibasa near Sambandou, Codd 6901; Minga, Gerstner 6219. 2231 (Pafuri): Kruger National Park, near Punda Milia, Van der Schiff 986; Van der Schiff 2894.

A. amara subsp. sericocephala may be readily distinguished from A. harveyi by its longer leaves, more numerous pinnae and leaflet pairs, and by the apex of the leaflets not being acute and distinctly falcate. Subsp. sericocephala differs from A. brevifolia in the longer leaves, more numerous pinnae and leaflet pairs, and in the dense spreading golden indumentum on the young branchlets.

Typical subsp. amara, which differs in having fewer pinnae and leaflet pairs, is found in India, Kenya, Tanzania and Mozambique.

3. Albizia harveyi Fourn. in Bull. Soc. Bot. Fr. 12: 399 (1865); Bak.f., Leg. Trop. Afr. 3: 865 (1930); Burtt Davy, Fl. Transv. 2: 348 (1932); Steedman, Trees etc. S. Rhod. 16 (1933); Brenan, Checklist Tang. Terr. 341 (1949); in Mem. N.Y. Bot. Gdn. 8: 430 (1954); Gomes e Sousa, Dendrol Moçamb. 4: 46 (1949); Codd, Trees & Shrubs Kruger Nat. Park 56, figs. 49-51 (1951); Gilbert & Boutique in F.C.B. 3: 173 (1952); O. B. Miller in J.S. Afr. Bot. 18: 27 (1952); Codd in Bothalia 7: 71 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 149, fig. 20 (1959); F. White, For. Fl. N. Rhod. 89, fig. 16G (1962); Von Breitenbach, Indig. Trees S. Afr. 2: 256 (1965); Gomes e Sousa, Dendrol. Mocamb. 1: 235, t.39 (1966); Compton in J.S. Afr. Bot. Suppl. 6: 45 (1966); Schreiber in F.S.W.A. 58: 14 (1967); Brenan in F.Z. 3, 1: 122, t.22 (1970); Van Wyk, Trees Kruger Nat. Park 1:118 (1972); Palmer & Pitman, Trees S. Afr. 2:713 (1973). Type: Botswana, near Lake Ngami, McCabe (K, holo.!).

A. pallida Harv. in F.C. 2: 284 (1862) nom. illegit., non A. pallida Fourn. in Ann. Sci. Nat. Ser. IV, 14: 375 (1860). Type as for A. harveyi. A. hypoleuca Oliv. in F.T.A. 2: 356 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 567 (1875). Type as for A. harveyi.

Tree up to 15 m high, crown narrowly rounded or rounded. *Bark* grey-brown to blackish, rough, fissured; young branchlets with grey to brown or sometimes slightly

golden spreading pubescence, a very small prickle-like outgrowth often present beneath each node. Leaves often golden-tomentose when very young, rusty to grey-pubescent when older: petiole 0,8-3 cm long, adaxial gland often prominent and sometimes shortly stalked and up to 1 mm high, often absent; rhachis 2,4-9(15) cm long; pinnae 6-22 pairs; rhachillae 1-3,4 cm long; leaflets (6)12-28 pairs, $2-6 \times 0.5-1.5$ mm, ± falcate, apex asymmetric, acute, turned towards the apex of the pinna, midrib nearer the distal margin, lateral nerves \pm raised and visible beneath, lower surface of leaflet paler than upper, \pm appressed-pubescent on both surfaces or the lower only when young, becoming sparingly pubescent to glabrescent with age. Inflorescences globose: peduncles 1,5-4 cm long, + golden-pubescent when young, becoming greyish when older. Flowers creamy-white, sessile or up to 0,5 mm golden-pubescent: pedicellate. buds bracteoles persistent during flowering period. Calyx 1,5-2,5 mm long, golden-pubescent, lobes ± 0,5 mm long. Corolla 4-5,5 mm long, pubescent, tube to 3 mm long, lobes to 2,5 mm long. Stamens 1,3-1,8 cm long, united basally for \pm 2,5 mm, tube not or scarcely exserted beyond the corolla. Ovary ± 2 mm long, very shortly stipitate, puberulous. *Pods* yellowish-brown to brown, $6-15 \times 10^{-15}$ 1,8-3,5 cm, oblong, valves thin, glabrous or nearly so except for a slight pubescence along the margins and near the base, umbonate over the seeds, longitudinally dehiscent. Seeds $8-12 \times 6-9$ mm, flattened.

Widespread in eastern and southern tropical Africa from southern Kenya in the north to South West Africa, Botswana, the Transvaal and Swaziland. Occurs in woodland and dry bushveld, sometimes near rivers.

S.W.A.—1719 (Runtu): Runtu, Volk 2030 (M). 1724 (Katima Mulilo): Katima Mulilo, West 3249. 1821 (Andara): Andara, Volk 2090 (M). 1920 (Tsumkwe): 9,6 km S. of Tsumkwe, Giess 9898 (M).

TRANSVAAL.—2229 (Waterpoort): Dongola reserve, Cream of Tartarfontein, Pole Evans 3526. 2230 (Messina): Messina, Pole Evans 1440. 2231 (Pafuri): Kruger National Park, Punda Milia, Codd 4223. 2328 (Baltimore): 32 km E. of Ellisras, Acocks 8820. 2331 (Phalaborwa): Kruger National Park, Letaba area, Lang sub TRV 30357. 2431 (Acornhoek): Kruger National Park, near Skukuza camp, Letty 57. 2531 (Komatipoort): Kruger National Park, 20 km N.E. of Malelane on road to Skukuza, Codd 5218.

MIMOSOIDEAE

Vegetative specimens of A. harveyi are sometimes confused with specimens of A. brevifolia. The differences between the two species are given under A. brevifolia.

4. Albizia forbesii Benth. in Hook., Lond. J. Bot. 3: 92 (1844); Harv. in F.C. 2: 284 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 568 (1875); Sim, For. Fl. P.E. Afr. 58, t.39A (1909); Burtt Davy, Fl. Transv. 2: 348 (1932); Codd, Trees & Shrubs Kruger Nat. Park 54, fig. 48a (1951); in Bothalia 7: 72 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 151 (1959); Von Breitenbach, Indig. Trees S. Afr. 2: 256 (1965); Gomes e Sousa, Dendrol, Mocamb, 1: 236. t.40 (1966); Brenan in F.Z. 3, 1:122 (1970); Van Wyk, Trees Kruger Nat. Park 1: 116 (1972); Palmer & Pitman, Trees S. Afr. 2: 717 (1973); Ross, Fl. Natal 192 (1973). Type: Mozambique, Delagoa Bay, Forbes s.n. (K, holo!; P!; TCD!).

Tree to 20 m high, with a single trunk or sometimes branching near the base, crown typically rounded and spreading. Bark grey to blackish, rough or sometimes smooth; young branchlets densely grey-pubescent. Leaves densely grey-pubescent, often golden when very young: petiole 0,6-2 (2,8) cm long, adaxial gland low, up to +0.25 mm high: rhachis 0,5-3,8 cm long, with a fairly conspicuous gland at the junction of each pinna pair or the top 1-3 pairs only; pinnae 2-7 pairs; rhachillae 1,6-4,8 cm long; leaflets 6-16 pairs, $3,5-8 \times 1,5-4$ mm, obliquely oblong to oblong-elliptic (the terminal pair obovate), apex rounded to subacute or mucronate, turned towards the apex of the pinna, the midrib nearer the distal margin, lateral nerves usually ± raised and visible beneath, usually glabrous above, glabrous beneath except for spreading pubescence on the midrib and recurved margins, sometimes pubescent throughout. Inflorescences globose; peduncles 2-5,5 cm long, \pm golden-pubescent when young, becoming greyish when older. Flowers creamy-white, sessile or almost so, buds golden-pubescent; bracteoles 1,5-2 mm long, linear or oblanceolate, usually deciduous before flowers open. Calyx 3-4 mm long, densely and shortly appressed-pubescent. Corolla 5-8(9) mm long, densely and shortly appressed-pubescent, tube 4-5(7) mm long, lobes up to 2,5 mm long. Stamens 1-1,5 cm long, united

basally for \pm 3 mm, tube not or scarcely exserted beyond the corolla. Ovary 2–3 mm long, shortly stipitate, glabrous. Pods dark brown or reddish-brown, 9–18 cm (including 1–2 cm long stipe) \times 3,2–5 cm, oblong, valves fibrous, puberulous or almost glabrous except on margins and stipe, very prominently transversely venose, the veins \pm parallel and 2–4 mm apart, margins thickened. Seeds $11-12 \times 4,5-6,5$ mm, oblong-ellipsoid or ellipsoid, slightly flattened.

Found in southern Tanzania, Mozambique, the eastern areas of Rhodesia, the Transvaal and Natal (Tongaland). Occurs in woodland, bushveld and sand-forest.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, near Punda Milia, Rowland Jones 29. 2431 (Acornhoek): Kruger National Park, 12,8 km E. of Skukuza, S. side of Sabie River, Codd 5704. 2531 (Komatipoort): Kruger National Park, near Malelane, Van der Schijff 1417.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, E. of Pongola floodplain, *Pooley 1403* (K, NU). 2732 (Ubombo): 12,8 km from Makanes bridge on road to Sihangwane, *Ross 2425*.

In Tongaland A. forbesii occurs commonly on white sandy soils and is one of the dominant species in sand-forest.

The prominently transversely venose pods are most distinctive, and the seeds are rather narrow in proportion to their length.

5. Albizia versicolor Welw. ex Oliv. in F.T.A. 2: 359 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 562 (1875); Hiern, Cat. Afr. Pl. Welw. 1:315 (1896); Eyles in Trans. Roy. Soc. S. Afr. 2: 717 (1973); Ross, Fl. Natal 192

(1973). Type: Angola, Cuanza Norte: Golungo Alto, Candombo e Trombeta, Welwitsch 1760 (LISU, lecto; BM!; COI; K!: P!: iso.).

A. versicolor var. mossambicensis Schinz in Bull. Herb. Boiss., Sér. 2, 2: 946 (1902); Bak.f., Leg. Trop. Afr. 3: 863 (1930). Type: Mozambique, Baruma, Nhaondue, Menyharth 77b (Z, holo.!). A. mossambicensis Sim, For. Fl. P.E. Afr. 59, t.60 (1909); Eyles in Trans. Roy. Soc. S.Afr. 5: 361 (1916). Type: Mozambique, Sim 6392 (NU, holo.!).

Tree to 18 m high with a spreading rounded crown. Bark greyish-brown, usually rough; young branchlets densely rustytomentose, older branchlets grey-tomentose. Leaves densely rusty-tomentose when young, becoming grey-pubescent when older: petiole 3-7,5 cm long, adaxial gland usually present and situated a short distance above the pulvinus, usually flattened, ±discoid, up to 3×2 mm; rhachis 0-18 cm long; pinnae 1-3(5) pairs; rhachillae 2-15 cm long, usually with a small gland below the junction of the top or top 1-2 pinnae pairs; leaflets 2-5(6) pairs, $15-67 \times (10)15-45$ mm, broadly and obliquely obovate or obovateoblong to subcircular, apex rounded and often mucronate, sometimes subacute or emarginate, becoming coriaceous, pubescent above, densely tomentose or pubescent beneath, midrib and lateral nerves raised and very prominent beneath. Inflorescences globose; peduncles 2-6 cm long, rusty-tomentose. Flowers creamy-white, sessile or subsessile; bracteoles present or already deciduous at flowering time. Calyx 4,5-7 mm long, densely rusty-pubescent or -tomentose. Corolla 7–12 mm long, clothed like the calyx. Stamens 2,5-4 cm long, united basally for \pm 3 mm, tube not exceeding the corolla. Ovary \pm 3 mm long, subsessile, puberulous. Pods chestnut- to reddish-brown or purplish, $8-22 \times (2,2)3-5,5$ cm, oblong, valves thin, glabrous or with few hairs on stipe and margins, ±glossy, obscurely transversely venose, margins thickened, longitudinally dehiscent. Seeds 9-13 \times 8-11 mm, flattened.

Found from Uganda and Kenya southwards to South West Africa, Botswana, Rhodesia, Mozambique, the Transvaal, Swaziland and Natal (Zululand). Occurs in mixed woodland.

A very distinct and easily recognized species on account of the combination of the±rust-coloured indumentum over the vegetative parts, and the few pairs of broad leaflets.

The type specimen of A. mossambicensis Sim is cited as Sim 6392. The holotype in the University of Natal Herbarium is actually annotated by Sim as A. umbelusiana, but the specimen clearly agrees with his description and plate of A. mossambicensis and not with his published description and plate of A. umbalusiana (see notes under A. anthelmintica and A. petersiana subsp. evansii).

A. versicolor grows into an attractive large tree and yields a useful timber. Brenan 1.c. (1949), in addition to mentioning that the timber is used, records that the natives make a soapy substance from the roots and that the roots are also employed as an anthelmintic and as a purgative and enema.

The unripe pods and seeds of A. versicolor have proved to be toxic to stock (Needham & Lawrence in Rhod. Agric. J. 63: 137, 1966).

6. Albizia antunesiana Harms in Bot. Jahrb. 30: 317 (1901); R.E. Fr., Schwed. Rhod.-Kongo-Exped. 1: 63 (1914); Eyles in Trans. Roy. Soc. S. Afr. 5: 361 (1916); Bak.f., Leg. Trop. (1965); Schreiber in F.S.W.A. 58: 14 (1967); Brenan in F.Z. 3, 1: 119 (1970); Palmer & Pitman, Trees S. Afr. 2: 720 (1973); Schreiber in Mitt. Bot. Staatssamml. Munchen 11: 126 (1973). Syntypes: Tanzania, Mbeya District, Unyika, Iyunga village, Goetze 1372 (B, †; BM!; P!); Angola, Huila, Antunes 330 (B, †).

Tree up to 12 m high, branches usually spreading somewhat. Bark grey, rough or sometimes smooth; young branchlets very shortly pubescent, becoming glabrous with age. Leaves: petiole 3-8,5 cm long, adaxial gland usually immediately above or a short distance above the pulvinus, humped or flattened and \pm discoid and up to 4 \times 4 mm; rhachis 0-13 cm long, sparingly pubescent when young but soon becoming glabrous or almost so; pinnae 1-4 pairs; rhachillae 5-16 cm long; leaflets 4-9 pairs, (16)23-50 \times 8-28 mm (in our area), oblique, ovate to rhombicovate or elliptic-oblong, usually rounded or slightly emarginate apically, papery to subcoriaceous, glabrous, venose, glaucous, paler beneath. Inflorescences globose; peduncles 3,6-8 cm long, sparingly rusty-pubescent. Flowers creamy-white, sessile or up to 2 mm pedicellate; bracteoles small, rapidly deciduous and shed before flowering. Calyx (3)3,5-5,5 mm long, rusty-puberulous or -pubescent. Corolla 5,5-11 mm long, densely minutely appressed-pubescent, lobes up to 4 mm long. Starners 1,5-3 cm long, united basally for up to 5 mm, tube not or scarcely exserted beyond the corolla. Ovary + 2 mmlong, shortly stipitate, glabrous. Pods 11-16 $(23) \times 2,5-4(4,6)$ cm, oblong, valves thin, glabrous or with few hairs near the base and margins, transversely venose, umbonate over the seeds, longitudinally dehiscent. Seeds ± 7-9 mm in diameter, flattened.

Found in Tanzania, Zaire, Angola, Zambia, Malawi, South West Africa, Botswana, Rhodesia and Mozambique. Occurs in mixed woodland.

S.W.A.—1821 (Andara): between Bagani camp and Mahango, *De Winter & Wiss 4394*; opposite Andara, *De Winter & Marais 4816*.

Vegetative specimens of A. antunesiana are easily recognized by the glabrous, discolorous leaflets, but the flowers are often produced when the tree is leafless.

A. antunesiana is closely related to A. coriaria Welw, ex Oliv., the latter differing in having puberulous or pubescent leaf-rhachides and usually smaller, less oblique leaflets.

More material of A. antunesiana from our area, particularly fertile material, is needed.

7. Albizia tanganyicensis Bak. f. in J. Bot. 67: 199 (1929); Leg. Trop. Afr. 3: 862 (1930); Brenan, Checklist Tang. Terr. 342 (1949); Torre in C.F.A. 2: 293 (1956); Codd in Bothalia 7: 75 (1958); Brenan in F.T.E.A. Legum.—Mimos.: 144 (1959); F. White, For. Fl. N. Rhod. 90 (1962); Von Breitenbach, Indig. Trees S. Burtt 716 (BM, holo.!; EA; K!).

subsp. tanganyicensis.

Brenan in Kew Bull. 29: 717 (1975). Type as above.

A. rhodesica Burtt Davy, Fl. Transv. 2: xviii, 348 (1932); Codd, Trees & Shrubs Kruger Nat. Park 56 (1951); O. B. Miller in J. S. Afr. Bot. 18: 27 (1952); Pardy in Rhod. Agric. J. 51: 4 (1954); Palgrave, Trees Cent. Afr. 269 (1956). Syntypes: Rhodesia, Matopos, Galpin 7082 (PRE.!); Victoria Falls, Allen 174 (K!); Rogers 5319 (K!). A. lebbeck var. australis Burtt Davy in Burtt Davy & Hoyle, Checklist Nyasaland 53 (1936) nomen nudum; Burtt Davy & Hoyle, rev. Topham, Checklist Nyasaland, ed.2: 65 (1958) nomen nudum.

Tree up to 12 m high, sometimes sparingly branched near the base and with few ascending branches, crown rounded or somewhat flattened, canopy often sparse. Bark smooth (except at base of trunk where burned), creamy-white to light ochre-yellow or yellow-green when young, the older bark peeling off in large papery pieces; young branchlets pubescent to glabrous. Leaves sparingly pubescent especially when young but often becoming glabrous: petiole 2-5(8) cm long, adaxial gland usually just above the pulvinus or \pm midway along length of petiole, fairly conspicuous and up to 3 mm long; rhachis 6-14(23) cm long; pinnae (2)3-6(7) pairs; rhachillae (2,8)3,5-19 cm long, sometimes with a gland at the junction of the top or top 1-5 leaflet pairs; leaflets 4-13(17) pairs, $(9)13-45(55) \times 5-25(32)$ mm, somewhat asymmetric, ovate- to obovate-elliptic ovate-oblong, rounded to subacute apically, papery to subcoriaceous, pubescent on both surfaces or glabrous, venose. Inflorescences globose; peduncles 3-5 cm long, rusty-pubescent. Flowers creamy-white. usually produced before the young leaves, sessile or up to 1 mm pedicellate; bracteoles rapidly deciduous and shed before the flowers

open. Calyx 4-6 mm long, densely \pm rustytomentellous on the lobes, lobes up to 2 mm long. Corolla 7-11 mm long, lobes up to 4 mm long, \pm rusty-tomentellous, especially apically. Stamens 1,5-3 cm long, united basally for \pm 4 mm, tube not or scarcely exserted beyond the corolla. Ovary \pm 3 mm long, shortly stipitate, glabrous. Pods brown, $10-25 \times 2$,5-5 cm, oblong, valves slightly thickened, glabrous, not or obscurely venose, longitudinally dehiscent. Seeds \pm $10-17 \times 8-13$ mm, flattened.

Found in Tanzania, Zambia, Malawi, Angola, South West Africa, Botswana, Rhodesia, Mozambique and the Transvaal. Occurs usually on rocky outcrops and ridges, often on quartzite and granite formations.

S.W.A.—1813 (Ohopoho): Oruwanjei on Orupembe-Ohopoho Road, *Joubert 297* (M); 4,8 km E. of Oruwanjei, near Kaoko-Otavi, *Giess 10533* (M).

TRANSVAAL.—2231 (Pafuri): Kruger National Park, near Punda Milia, Codd & Dyer 4549. 2427 (Thabazimbi): Rooiberg, Pole Evans s.n. 2428 (Nylstroom): 30,4 km E. of Vaalwater, Codd 986; 8 km N.E. of Nylstroom, Codd 5601; 16 km N. of Warmbaths on road to Nylstroom, De Winter 8681; hills near Warmbaths, Burtt Davy 2183; Olifants Spruit, Repton 3472.

A very distinct species which is readily distinguished by its thin smooth papery-peeling bark. The flowers are usually produced when the tree is leafless, and specimens collected in this state, without notes about the bark, are liable to be confused with specimens of A. antunesiana in the same state. Apart from having an entirely different distribution in our area, A. antunesiana may be distinguished by its smaller flowers and (in dried specimens) by the more prominent and raised nerves on the calyx-tube.

A. tanganyicensis has in the past been confused with the introduced A. lebbeck (L.) Benth., but the two are quite distinct. Vegetative specimens of the two species are similar but A. tanganyicensis differs in its papery peeling bark and in its more closely spaced leaflets. In A. tanganyicensis the flowers are sessile or up to 1 mm pedicellate and the corolla-lobes are rusty-tomentellous especially apically, while in A. lebbeck the flowers are on pedicels 1,5-4,5 mm long and the corolla-lobes have few whitish hairs. The pods of the two species also differ, those of A. lebbeck being straw-coloured and the positions of the seeds marked by distinct bumps in the valves, while in A. tanganyicensis they are brown and there are no conspicuous bumps in the valves indicating the positions of the seeds within.

The wood of A. tanganyicensis is of no commercial value and Codd 1.c.: 76 reports that when the wood is worked the dust irritates the nose and throat, so that in the Transvaal it is locally known as "sneezewood".

8. Albizia suluensis Gerstn. in J. S. Afr. Bot. 13: 62, fig. 6 (1947); Codd in Bothalia 7: 76 (1958); Von Breitenbach, Indig. Trees

S. Afr. 2: 259 (1965); Ross, Fl. Natal 192 (1973); Palmer & Pitman, Trees S. Afr. 2: 723 (1973). Type: Natal, Melmoth Distr., 3,2 km west of Dundulu Store, *Gerstner* 4337 (PRE, lecto.!).

Tree to 15 m high with a rounded or spreading crown. Bark greyish, smooth or fissured; young branchlets sparingly pubescent when young but soon becoming glabrous. Leaves glabrous or subglabrous: petiole 2-7 cm long, a small rounded slightly raised gland usually present at or just below the junction of the lowest pinna pair; rhachis (0)2-8 cm long, sulcate above, a small rounded gland usually present at the junction of the top pinna pair, at the junction of each pinna pair or absent from some; pinnae (1)2-4 pairs; rhachillae 5,5-17 cm long, sulcate above, pulvinule sometimes sparsely pubescent; leaflets 4-9 pairs, 18-28 × 8-15 (18) mm, oblique basally, oblong to broadly elliptic or obovate, rounded to truncate apically, mucronate, margins crisped, glabrous to sparsely puberulous on both surfaces, petiolules often sparsely pubescent. Inflorescences globose; peduncles 1,5-4 cm long, sparingly rusty-pubescent. Flowers whitish, subsessile; bracteoles rapidly deciduous. Calyx 2,5-4 mm long, densely±rustytomentellous. Corolla 4-6 mm long, lobes densely + rusty-tomentellous, especially apically. Stamens 1-1,6 cm long, united basally for up to 6 mm, tube not or scarcely exserted beyond the corolla. Ovary 2-3 mm long, shortly stipitate, glabrous. Pods light brown, $8-21 \times 1,4-2,6$ cm, linear-oblong, valves thin, glabrous, not or scarcely venose, slightly umbonate over the seeds, longitudinally dehiscent.

Restricted to the Ntonjaneni and Hlabisa districts of Zululand. Occurs in forest, often on stream banks or near streams.

NATAL.—2732 (Ubombo): Dukunbane, Gerstner 714. 2831 (Nkandla): Hlabisa, Gerstner 6440; Gwegwede River, Gerstner 6261 (BOL, K.); Ndhlwati, Gerstner 730; Inhlwati, F. Bayer s.n. (K, NU); 6,4 km N. of Hlabisa, Codd 9611. 2832 (Mtubatuba): Hluhluwe Ganne Reserve, Ward 2829 (K, NH).

A very distinct species which is distinguished by the crisped leaflet margins. It appears to be endemic in the Ntonjaneni and Hlabisa districts of Zululand and is nowhere very common.

Gerstner 1.c. records that the Zulu's pound the bark in water, producing a foaming mixture which is used as a powerful enema. The timber is said to be hard and durable with an attractive grain, suitable for furniture.

Albizia anthelmintica (A. Rich.) Brongn. in Bull. Soc. Bot. Fr. 7: 902 (1860): Oliv. in F.T.A. 2: 357 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 564 (1875); Sim, For. Fl. P.E. Albizia umbalusiana Sim, For. Fl. P.E. Afr. 59, t.55A (1909). Type: Mozambique, "Lourenzo Marques, Maputa, Lebombos", Sim 6200 (whereabouts unknown, perhaps no longer extant). A. anthelmintica var. australis Bak.f., Leg. Trop. Afr. 3: 859 (1930); Torre in C.F.A. 2: 290 (1956). Type: South West Africa, Okahandja Distr., Okahandja, Dinter 269 (BM, holo.!; GRA!; K!; P!; PRE!; SAM!). A. anthelmintica var. pubescens Burtt Davy, Fl. Transv. 2: xvii, 348 (1932); O. B. Miller in J. S.Afr. Bot. 18: 27 (1952). Syntypes: Transvaal, Soutpansberg Distr., Waterpoort, Rogers 19347 (K!; PRE!); Messina, Rogers 21504 (PRE!).

Shrub or tree to 10 m high, crown often somewhat rounded. Bark grey to reddishbrown, smooth; young branchlets shortly pubescent or glabrous, lenticellate, often forming abbreviated divaricate spine-tipped lateral shoots. Leaves glabrous to shortly pubescent: petiole 0,5-2 cm long, a small gland usually present \pm midway along the petiole or just below the junction of the

lowest pinna pair; rhachis 0-3,5 cm long, usually terminating in a short rigid persistent deflexed hook, a small gland often present near the junction of the top pinna pair; pinnae 1-3(4) pairs; rhachillae 1,5-5 cm long, usually terminating in a short rigid persistent deflexed hook, often a single stipel similarly bent near the base; leaflets (1)2-4(6) pairs, $(5)8-25(30) \times 4-18(24)$ mm (in our area), obliquely obovate or elliptic to subrotund, mucronate apically, venose, glabrous or sparingly pubescent beneath, especially on the midrib and lateral nerves. Inflorescences globose; peduncles 1-3 cm long, glabrous or sparingly pubescent. Flowers usually borne on leafless branchlets, whitish, on pedicels 0,5-2,5 mm long; bracteoles rapidly deciduous. Calyx greenish, 3-5 mm long, usually deeply slit unilaterally, glabrous throughout or with a tuft of hairs at the apex of each lobe, sometimes sparingly pubescent throughout. Corolla greenish, 6-12 mm long, glabrous throughout or puberulous near the apices and margins of the lobes. lobes up to 5 mm long. Stamens 1,5-2,8 cm long, united basally for up to 4 mm, tube not exserted beyond the corolla. Ovary + 3 mm long, glabrous, shortly stipitate. Pods straw-coloured to light brown when mature, $(6)8-18 \times 1,5-2,8$ cm, oblong, valves thin, glabrous or occasionally puberulous all over, venose, umbonate over the seeds, longitudinally dehiscent. Seeds 9-13 mm in diam.. rounded, flattened.

Found from the Sudan and Ethiopia southwards to Angola, South West Africa, Botswana, Rhodesia, Mozambique, the Transvaal, Swaziland and Zululand. Occurs in dry bushveld, scrub, woodland and sand forest.

In our area A. anthelmintica is usually \pm pubescent, whereas in the northern part of its distributional range it is typically glabrous. These pubescent specimens in the southern part of the species range were separated as var. pubescens by Burtt Davy, but there are so many gradations connecting the glabrous and pubescent specimens that var. pubescens is not considered worthy of formal taxonomic recognition.

Codd 1.c.: 78 (1958) drew attention to the possibility that Sim based his A. umbalusiana on a mixture of A. anthelmintica and A. petersiana subsp. evansii. The flowering twig with spine-tipped branchlets illustrated by Sim in Plate 55A of his For. Fl. P.E. Afr. (1909) is definitely A. anthelmintica; in A. petersiana subsp. evansii spine-tipped branchlets are absent and the staminal tube is long and exserted far beyond the corolla. The pods and two leaves illustrated are more difficult to identify with certainty, but the possibility does exist that they may be those of A. petersiana subsp. evansii. However, in the absence of Sim's type specimen, it is unlikely that the leaves and pods illustrated will ever be identified with certainty. It is, of course, possible that they are indeed those of A. anthelmintica after all.

The bark and roots of A. anthelmintica are used as an anthelmintic, whence the specific epithet.

10. Albizia petersiana (Bolle) Oliv. in F.T.A. 2:362 (1871); Benth. in Trans. Linn. Soc. Lond. 30:569 (1875); Gilg in Pflanzen. Ost Afr. B:299 (1895); Sim, For. Fl. P.E. Afr. 60 (1909); Bak.f., Leg. Type: Mozambique, Boror and Sena, 16-18°S. lat., Peters (B, holo.†; BM!).

Zygia petersiana Bolle in Peters, Reise Mossamb. Bot. 1:1, t.1 (1861). Type as above.

subsp. evansii (Burtt Davy) Brenan in Kew Bull. 21: 482 (1968); in F.Z. 3, 1: 133 (1970); Van Wyk, Trees Kruger Nat. Park 1: 114 (1972); Palmer & Pitman, Trees S. Afr. 2: 727 (1973); Ross, Fl. Natal 192 (1973). Type: Transvaal, Nelspruit District, Sabie Game Reserve, Pole Evans H16921 (K, holo.!).

Albizia evansii Burtt Davy, Fl. Transv. 2: xvii, 348 (1932); Gomes e Sousa, Dendrol. Mocamb. 2: 54 (1951); Dendrol. Mocamb. 1: 238, t.42 (1966); Codd, Trees & Shrubs Kruger Nat. Park 54, fig.47, 48b (1951); in Bothalia 7: 79 (1958); Von Breitenbach, Indig. Trees S.Afr. 2: 262 (1965). Type as above.

Shrub or tree up to 10 m high, usually branching freely near the base with many ascending branches, sometimes single-stemmed, crown rounded or somewhat flattened. Bark grey to brown, usually smooth; young branchlets densely pubescent, not forming abbreviated spine-tipped shoots. Leaves + densely pubescent: petiole 0,5-2,4 cm long, a small gland usually present + halfway along the petiole; rhachis (0)0,8-3 cm long, a small gland often present at the junction of the top or top two pinnae pairs; pinnae (1)2-3(4) pairs; rhachillae 0,5-3 cm long, a small gland often present just below the junction of the top pair of leaflets; leaflets 2-5 pairs, $(4,5)8-22 \times (3,5)5-13$ mm, obliquely obovate or obovate- to oblong-rhombic, obtuse to mucronate apically, dark green above, glabrous or sparsely pubescent, lower surface paler, sparingly to ± densely pubescent, especially on midrib and lateral nerves. Stipules rapidly deciduous, $1,75-3,5 \times 0,6-1$ mm, oblanceolate or triangular-acute. Inflorescences globose; peduncles 0,8-1,5(2) cm long, + densely pubescent. Flowers whitish. usually tinged with red, on pedicels up to 2 mm long; bracteoles \pm 1 mm long, rapidly deciduous. Calyx 1-1,75 mm long, very shallowly lobed apically, glabrous except for apices of lobes or puberulous throughout. Corolla 6–9 mm long, glabrous throughout or sparingly pubescent near the apices of the lobes. Stamens 1,6-2,5 cm long, united into a narrow tube for most of their length, tube reddish, exserted beyond the corolla for 1-1.5 cm. Ovary ± 2.5 mm long, glabrous, shortly stipitate. *Pods* brown, $6-16 \times 1,4-2$ cm, oblong, valves semi-woody, shortly pubescent or puberulous, obscurely venose, longitudinally dehiscent. Seeds 9-12 mm long or in diam., flattened.

Found in Rhodesia, southern Mozambique, the Transvaal and Zululand. Occurs in woodland and scrub.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, 3,2 km S. of Punda Milia, Codd 5990. 2431 (Acornhoek): Kruger National Park, 32 km N.E. of Skukuza, Codd 5592. 2531 (Komatipoort): Kruger National Park, 9 km S.W. of Lower Sabie Camp, Codd 5708.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, Gerstner 3440; Ward 3179. 2732 (Ubombo): 24 km from Ingwavuma on Ndumu road, Moll 3708; 1,6 km E. of Makanes Drift, Ross 1966.

Subsp. petersiana is found in Uganda, Kenya, Tanzania, Malawi and northern Mozambique. It differs from subsp. evansii in having only shortly pubescent or glabrous young branchlets, typically more numerous leaflet pairs, sparingly pubescent or glabrous peduncles and ± glabrous pods. Although subsp. petersiana is not clearly separable from subsp. evansii by any single character except perhaps the ± glabrous pods, the above characters in combination usually enable subsp. petersiana to be distinguished.

Attention has already been drawn (see note under A. anthelmintica) to the possibility that the description and illustration of A. umbalusiana Sim are drawn from A. anthelmintica and from A. petersiana subsp.

The leaves of A. anthelmintica bear a superficial resemblance to those of A. petersiana subsp. evansii. However, the rhachides and rhachillae of the latter are not terminated by a short rigid persistent deflexed hook, the base of the rhachillae lack a stipel, and the leaflets are sparingly to \pm densely pubescent beneath, while those of A. anthelmintica are glabrous or with few scattered hairs on the midrib and nerves beneath except in some specimens from South West Africa where the leaflets are also \pm pubescent.

Types as for Zygia fastigiata. A. gummifera sensu C.A. Sm. in Kew Bull. 1930: 218 (1930), pro parte quoad syn. Mimosa adianthifolia ["adiantifolia"], Zygia fastigiata, Albizia fastigiata; Burtt Davy, Fl. Transv. 2: 349 (1932); Henkel, Woody Pl. Natal 236 (1934), non (J.F. Gmel.) C.A. Sm. sensu stricto.

Tree to 20 m high, crown typically flattened and spreading. Bark grey to yellowish-brown, smooth or rough; young branchlets densely and rather coarsely and persistently rusty- to fulvous-pubescent, indumentum sometimes becoming grey with age. Leaves rusty- to fulvous-pubescent, indumentum sometimes becoming grey with age: petiole 2,4-7 cm long, a large raised gland usually situated immediately above or a short distance above the pulvinus; rhachis (3)5,5-14 cm long, a small rounded gland usually present at or just below the junction of the top pinna pair; pinnae 4-8 pairs; rhachillae (2)3-10 cm long; leaflets (4)6-15 pairs, $7-20 \times 4-8(11)$ mm (in our area), obliquely rhombic-quadrate or -oblong, proximal margin usually ± rounded into the pulvinule basally and not auriculate, midrib diagonal, usually obtuse and mucronate apically, sometimes subacute, upper surface dark green and thinly pubescent, lower surface paler, usually \pm appressed-pubescent throughout but especially on midrib and margins. Stipules and bracts at base of peduncles $5-12 \times 3-8(11)$ mm, ovate. Inflorescences globose; peduncles 2,5-4,5(6) cm long, densely rusty- to fulvous-pubescent. Flowers whitish, on pedicels 0,5-1 mm long; bracteoles 5-8 mm long, linear-spathulate to oblanceolate, exceeding the flower-buds, variably persistent and sometimes deciduous before the flowers open. Calyx 2,5-5 mm long, fulvo-pubescent. Corolla 6-10 mm long, pubescent, tube 5-8 mm long, lobes 2-3 mm long. Stamens 2-3,2 cm long, united into a narrow tube for most of their length, tube exserted beyond the corolla for 1,3-2,5 cm. Ovary ± 2,5 mm long, glabrous, subsessile. Pods pale brown, $(7,5)9-19 \times$ 1,9-3,4 cm (in our area), oblong, valves thin textured, densely and persistently pubescent, not glossy, umbonate over the seeds, p ominently venose, margins thickened, longitudinally dehiscent. Seeds 7-9,5 \times 6,5-8,5 mm, flattened.

MIMOSOIDEAE

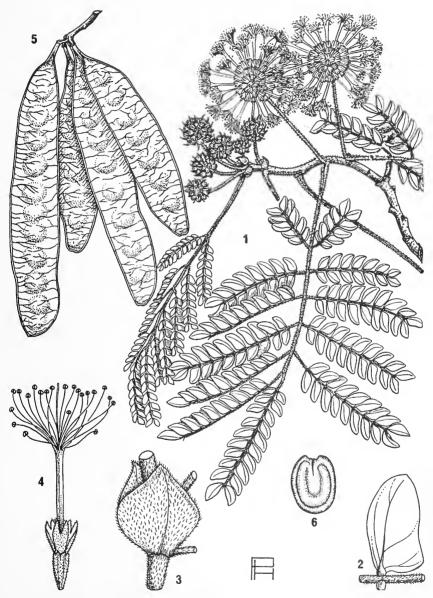

FIG. 2.—Albizia adianthifolia. 1, flowering branch, $\times \frac{2}{3}$, Ross 1369; 2, leaflet, undersurface, \times 2; 3, stipules \times 2, both from Ross 420; 4, flower, \times 2, Moll 1925; 5, pods, $\times \frac{2}{3}$; 6, seed, \times 2, both from Ross 2119.

Widespread in tropical Africa from Gambia in the west to Kenya in the east and southwards to Angola, Rhodesia, Mozambique, the Transvaal, Swaziland, Natal and eastern Cape Province. Occurs in forest, wooded ravines, woodland and wooded grassland; often, but by no means always, near water.

TRANSVAAL.—2230 (Messina): Kruger National Park, Shipudza, N.W. of Punda Milia, Van der Schijff 3784. 2330 (Tzaneen): Tshakoma, Obermeyer 975. Grid ref. unknown: Soutpansberg District, Shewass, Legat sub PRE 4867; Pepiti Falls, Curson & Irvine 97.

SWAZILAND.—Compton, in J. S. Afr. Bot., Suppl. 6: 45 (1966), recorded A. adianthifolia from Swaziland, but I have not seen any specimens from this territory.

NATAL.—2632 (Bela Vista): 10,4 km N.E. of Maputa on road to Ponta do Ouro, De Winter & Vahrmeijer 8619. 2732 (Ubombo): 6,4 km from Hluhluwe on road to False Bay Park, Ross 2119. 2831 (Nkandla): forest adjoining Eshowe, Codd 1864. 2832 (Mtubatuba): Nyalazi, 27,2 km S. of Hluhluwe on Mtubatuba road, Ross 1369. 2930 (Pietermaritzburg): Shongweni, Ross 420 (K, NH, NU). 2931 (Stanger): Umhlali, Repton 1838. 3030 (Port Shepstone): Uvongo, Strey 6842.

CAPE.—3129 (Port St. Johns): 4 km N, of Embotyi, Codd 9740; Egossa forest, Sim 2365; Port St. Johns, Bull sub Sim 19961.

A. adianthifolia, with its flattened spreading crown, is a conspicuous tree in the coastal areas of Natal. This characteristically flattened spreading crown has earned the species the common name "flat crown".

A. adianthifolia is very closely related to A. gummifera (J. F. Gmel.) C.A. Sm. The specific limits within this complex of species and the synonymy are dealt with in detail by Brenan in Kew Bull. 7:507 (1953). A. gummifera, which so far has not been recorded in our area, differs from A. adianthifolia in that the leaflets are markedly auriculate basally on the proximal side and are typically glabrous beneath apart from the pubescence on the midrib and margins; the young branchlets and leaf-rhachides are finely and shortly brownish-pubescent; the stipules are lanceolate, $\pm 6-7 \times 2-2.5$ mm; and the pods are glabrescent. A. gummifera is considered in more detail in F.T.E.A. Legum.-Mimos.: 157 (1959) and in F.Z. 3, 1:129 (1970). In territories outside our area A. adianthifolia and A. gummifera hybridize.

The nature of the bark was one of the differential characters between A. adianthifolia and A. gummifera noted by Brenan 1.c.: 510 (1953). In A. gummifera the bark is said to be usually smooth and only rarely rough, while in A. adianthifolia the bark in tropical east and south tropical Africa is said to be rough and only rarely smooth. Detailed field observations on bark characteristics in our area are necessary to establish whether our plants are predominantly smooth-barked or rough-barked, and whether this character is of any ecological or distributional significance.

Sim, For. Fl. Cape Col. 214 (1907), reported that the wood of A. adianthifolia is "straight grained, lighter than yellow-wood, easily worked, soft, with yellowish heart and whiter sapwood." The wood was formerly in great demand for use in wagon-building and other purposes.

12. Albizia lebbeck (L.) Benth. in Hook., Lond. J. Bot. 3: 87 (1844); in Trans. Linn. Soc. Lond. 30: 562 (1875); Sim, For. Fl. P.E. Afr. 60 (1909); Bak.f., Leg. Trop. Afr. 3: 862 (1930); Brenan, Checklist Tang. Terr. 342 (1949); Gilbert & Boutique in F.C.B. 3: 187 (1952); Torre in C.F.A. 2: 292 (1956); Codd in Bothalia 7: 81 (1958); Brenan in F.T.E.A. Legum.—Mimos.: 147 (1959); F. White, For. Fl. N. Rhod. 90 (1962); Brenan in F.Z. 3, 1: 118 (1970); Ross, Fl. Natal 192 (1973). Type: Egypt, Herb. Linnaeus 1228.16 (LINN!).

Mimosa lebbeck L., Sp. Pl. ed.1: 516 (1753). Type as above.

Acacia lebbeck (L.) Willd., Sp. Pl. 4: 1066 (1806); DC., Prodr. 2: 466 (1825). Type as above.

Tree to 15 m high with a rounded crown. Bark grey to light brown, rough; young branchlets glabrous or pubescent. Leaves subglabrous, puberulous or pubescent: petiole 4-8 cm long, usually with a raised gland a short distance above the pulvinus; rhachis (0)1,3-8(20) cm long, usually with a gland just below the junction of the top pinna pair; pinnae (1)2-4(5) pairs; rhachillae 4-11(16) cm long, often with a small gland below the junction of each leaflet pair; leaflets 3-9(11) pairs, $15-45 \times (6)8-24$ mm, obliquely oblong or elliptic-oblong (terminal leaflets ± obovate), somewhat asymmetric with the midrib nearer the upper margin, rounded or somewhat emarginate apically, glabrous or rarely thinly pubescent above, glabrous to pubescent beneath. Inflorescences globose; peduncles 4-8 cm long, sparingly puberulous to pubescent. Flowers whitish, on pedicels 1,5-4,5 mm long; bracteoles 2-3 mm long, rapidly deciduous. Calvx (2,5)3,5-5 mm long, grey- to fulvous-pubescent. Corolla 5,5-9 mm long, glabrous except for puberulence towards the apices of the lobes. Stamens 1,5-2,5 cm long, united basally for \pm 5 mm, tube not or scarcely exserted beyond the corolla. Ovary ± 2 mm long, glabrous. Pods straw-coloured to light brown, $(9)12-25(33)\times$ 3-4,5 cm, oblong, valves coriaceous, glabrous or almost so, glossy, ± venose, conspicuously umbonate over the seeds, margins thickened, very tardily dehiscent and often only after falling to the ground. Seeds 7-11,5 \times 7-9 mm, flattened.

Pantropical, probably a native of tropical Asia and nowhere indigenous in Africa. Introduced into our area and now naturalized along parts of the north coast of Natal.

NATAL.—2831 (Nkandla): Mtunzini, Ward 2996; Lawn 2118. 2930 (Pietermaritzburg): Oakford Clinic, Moll 3285. 2931 (Stanger): 3,2 km S. of Verulam, Codd 9653; Gingindhlovu, Lawn 1863 (NH).

The stiff straw-coloured or light brown pods with prominent bumps over the seeds are very characteristic. When agitated by wind the mature pods, and the seeds inside, are said to produce an incessant rattle that, according to Brenan in F.Z. 1.c.: 118, has been likened to women's chatter and the sound of fish being fried.

The specific epithet is said to be derived from the Arabian name "Labach" for the tree. The epithet "lebbeck" has often been misspelt "lebbek".

A. lebbeck has in the past been confused in the herbarium with A. tanganyicensis. The two species have very different distributional ranges in our area, and the morphological differences are discussed under A. tanganyicensis. A. lebbeck bears a slight resemblance to A. suluensis, but the latter may be readily distinguished by the crisped margins of the leaflets and by the golden indumentum on the calyx and corolla.

13. Albizia procera (Roxb.) Benth. in Hook., Lond. J. Bot. 3: 89 (1844); in Fl. Austral. 2: 422 (1864); in Trans. Linn. Soc. Lond. 30: 564 (1875); Bak. in Hook.f., Fl. Brit. Ind. 2: 299 (1878); Brenan, Checklist Tang. Terr. 342 (1949); Ross, Fl. Natal 192 (1973). Type: India, Roxburgh (K, painting of holotype material, No. 485!).

Mimosa procera Roxb., Pl. Corom. 2:12, t.121 (1799); Fl. Ind. 2:548 (1832). Type as above.

Acacia procera (Roxb.) Willd., Sp. Pl. 4: 1063 (1806); DC., Prodr. 2: 466 (1825); Wight & Arn., Prodr. Fl. Ind. 1: 275 (1834). Type as above.

Tree to 12 m high; bark smooth, yellowish to grey; young branchlets glabrous or subglabrous. Leaves glabrous or subglabrous to sparingly puberulous: petiole 5-8,5 cm long, with a large slightly raised elongated gland up to 11 mm long situated a short distance above the pulvinus; rhachis 3,5-13 cm long; pinnae 2-4 pairs; rhachillae 7-19(24) cm long; leaflets 5-11 pairs, 15-60 \times 8–21 mm, obliquely oblong, elliptic-oblong or obovate, apex obtuse or rounded, often somewhat emarginate, upper surface very sparingly appressed-pubescent, lower surface paler, appressed-pubescent. Inflorescences globose, in axillary or terminal panicles; peduncles glabrous or sparingly puberulous. Flowers whitish, sessile or almost so; bracteoles rapidly deciduous. Calyx 2-3 mm long, glabrous or almost so. Corolla 4-6 mm long, apices of lobes with a conspicuous tuft of hairs. Stamens up to 1,5 cm long, united basally, tube not or scarcely exserted beyond the corolla. Ovary glabrous. Pods light to dark brown, $8-16\times1,5-2$ cm, linear-oblong, acuminate apically, glabrous or almost so, obscurely venose, slightly umbonate over the seeds, longitudinally dehiscent. Seeds $6-8\times5-6,5$ mm, flattened.

A native of India. Introduced into our area and now naturalized in parts of Natal.

NATAL.—2931 (Stanger): 15,2 km S.E. of Mapumulo, Codd 9654; Thring's Post, Ward 3186.

A. procera bears a superficial resemblance to A. lebbeck, but differs in having the midrib of the leaflets ± centric, a panicled inflorescence, ± sessile flowers, and much smaller pods.

14. Albizia lophantha (Willd.) Benth. in Hook., Lond. J. Bot. 3: 86 (1844); in Fl. Austral. 2: 421 (1864); in Trans. Linn. Soc. Lond. 30: 559 (1875); Codd in Bothalia 7:81 (1958); Ross, Fl. Natal 192 (1973). Type: It is not known if the specimen on which Ventenat, Desc. Pl. Jard. Cels: 20, t.20, based his description and illustration is preserved; if not, t.20 will suffice as the type.

Acacia lophantha Willd., Sp. Pl. 4: 1070 (1806); DC., Prodr. 2: 457 (1825). Type as above.

Mimosa distachya Vent., Desc. Pl. Jard. Cels: 20, t.20 (1800 or 1801), non M. distachya Cav., Icon. 3(2): 48, t.295 (1795 or 1796). Type as above.

Albizia distachya (Vent.) MacBride in Contr. Gray Herb. 59: 3 (1919); Salter in Adamson & Salter, Fl. Cape Penins. 452 (1950). Type as above.

Tree to 7 m high; young branchlets usually ± golden-pubescent, becoming sparingly pubescent to glabrescent with age. Leaves ± golden-pubescent when young but often becoming grey-pubescent with age: petiole 4-7,5 cm long, a conspicuous elongated gland usually situated \pm midway along the length of the petiole; rhachis 10-20 cm long, usually with a gland just below the junction of the top pinna pair; pinnae 7-12 pairs; rhachillae 5-14 cm long; leaflets 20-35 pairs, $7-13 \times 1,75-3$ mm, obliquelyoblong or sometimes slightly falcate, the midrib nearer the upper margin, apex obtuse to rounded, mucronate, often turned towards the apex of the pinna, glabrous or sparingly pubescent, especially on the midrib. Inflorescences spicate; spikes axillary, solitary or

fascicled, 4-8 cm long; peduncles 0,8-1,5 cm long, fulvo-pubescent. Flowers creamy to yellowish-white, on pedicels 1-3 mm long. Calyx 2-2,5 mm long, pubescent, conspicuously toothed. Corolla 5-7 mm long, appressed-pubescent. Stamens 1,2-1,6 cm long, shortly united basally, tube not or scarcely exserted beyond the corolla. Ovary ± 2,5 mm long, glabrous, shortly stipitate. *Pods* light to dark brown, 5.5–11 \times 1.4–1.7 cm, linear-oblong, glabrous or almost so, obscurely venose, umbonate over the seeds, margins thickened. Seeds $+ 7 \times 5$ mm. flattened.

A native of the south-western coastal region of Western Australia. Introduced into our area and now naturalized, particularly in the Cape along the coast from Humansdorp to the Cape Peninsula.

NATAL.-Grid ref. unknown: south coast. Wood 10588 (K, NH).

CAPE.—3318 (Cape Town): Rondebosch, Gerstner 6135. 3418 (Simonstown): Simonstown, Watt & Brandwijk 1682; Kogel Bay, Parker 4206 (BOL, K). 3421 (Riversdale): Corente River farm, Muir sub Galpin 5092. 3423 (Knysna): Knysna, District Forest Officer sub PRE 8707. 3424 (Humansdorp): Humansdorp, Rogers 3021.

A. lophantha favours river banks, forest margins and wooded ravines. It is the only species of Albizia in our area with a spicate inflorescence.

3446 2. ACACIA

Trees or shrubs, sometimes scandent or climbing; the indigenous species in our area almost always armed with stipular spines or recurved prickles, the introduced species usually unarmed. Leaves bipinnate or (in some introduced species) often modified to phyllodes (flattened leaf-like organs without pinnae or leaflets); each pinna with one to many pairs of leaflets; gland on the upper side of the petiole usually present; glands also often present at point of attachment of pinnae (at least some) to the rhachis. *Inflorescences* usually axillary, racemose or paniculate; flowers in spikes or spiciform racemes (spicate) or in round heads (capitate), rarely (in A. redacta) only 2-4 flowers per head, flowers all hermaphrodite or male and hermaphrodite. Calyx (in our species) gamosepalous, usually with 4-5 teeth or lobes or subtruncate. Corolla 4-5(7)-lobed. Stamens many, fertile, their filaments free or (in A. albida and in A. redacta) shortly united into a tube at the base only; anthers (at least some) glandular apically at least in bud, or all eglandular (in all indigenous species glandular except in A. albida,

introduced species mostly eglandular). Ovary stipitate to sessile, glabrous to puberulous. Pods very variable, usually dehiscent but sometimes indehiscent, flattened, ±compressed, or sometimes almost cylindric, straight, curved, spiral or contorted, margins entire or moniliform, glabrous to pubescent. Seeds unwinged, exendospermous, often with a hard smooth testa.

A genus of 850–900 species, mostly tropical or subtropical; \pm 620 in Australia, \pm 115 in Africa, many in America and fewer in Asia. 44 indigenous species occur in our area and several Australian species have become naturalized.

The generic name Acacia is derived from the Greek word akis, meaning a sharp point.

In a few of our species the stipular spines are distinctly and characteristically swollen into structures commonly known as ant-galls. There is evidence that these structures may not be galls at all, but natural outgrowths of the plant itself. The presence of these structures is certainly taxonomically important. Following Brenan's decision in F.T.E.A. Legum.—Mimos.: 49 (1959), I have retained the familiar term "ant-gall" but have enclosed it in inverted commas. A new and more appropriate term may have to be devised.

The indigenous species of Acacia occurring in our area can be divided into groups and these groups form the basis of the sequence in which the species are arranged here. The primary division of the species is on the nature of the inflorescence, that is, whether the flowers are in spikes or in round heads. For use in a regional flora this is a convenient character to employ for the primary division of the species into two main artificial groups, but, as discussed in Bothalia 11: 107-113 (1973), when a more natural systematic division is sought it is the nature of the stipules, that is, whether they are spinescent or non-spinescent, that must be employed for separating the two main groups of species.

As Acacia is such an important genus in our area, and as many of the species seldom bear flowers and fully-formed pods at the same time, three alternative keys to the identification of the indigenous species are provided. The first key is a comprehensive one for use when flowering and fruiting (young fruits are often adequate) material is available. The second key is for use when only flowering material is available, and the third is for use when only fruiting material is present.

A few of the indigenous species often produce flowers when the plants are quite leafless. As difficulty may be experienced in keying out leafless flowering specimens, it may help to know which species most regularly flower when leafless. If the flowers are in elongate spikes (sometimes in short ellipsoid heads but even then the axis is clearly elongate), and the plants are armed with paired recurved prickles, the specimen is probably A. mellifera, A. nigrescens, A. galpinii or A. erubescens. If the flowers are in round heads and the plants are armed with paired straight stipular spines or a mixture of long and straight and short and recurved spines, then the specimen is probably A. tortilis, A. reficiens, A. hebeclada or A. stuhlmannii.

For convenience, A. farnesiana is keyed out under the indigenous species as it is more closely allied to some of the indigenous species than it is to any of the naturalized Australian species.

Keys to the indigenous species

Key to the groups

Flowers in spikes or spiciform racemes, rarely the inflorescences short and ellipsoid but even then the axis clearly elongate:	
Stipules spinescent, straight or almost so)
Stipules not spinescent; plants armed with prickles:	
Prickles irregularly scattered along the internodes)
Prickles at or near the nodes:	
Prickles in threes or solitary)
Prickles in pairs:	
Flowers distinctly pedicellate)
Flowers not distinctly pedicellate)
Flowers in round heads, very rarely inflorescence reduced, apparently capitate and with only 2-4 flowers per head:	S
Stipules not spinescent, plants armed with irregularly scattered recurved pricklesF (spp. 16-18)

Stipules spinescent:
Inflorescences with \pm 35–200 flowers per head:
Flowers bright or golden yellow:
Pods dehiscent. G (spp. 19–26)
Pods indehiscent:
Valves of pod markedly thickened, woody or pulpy in texture
Valves of pod thin
Flowers white or pale yellowish-white, rarely pink:
Pods ±transversely jointed, each joint bearing a wart-like projection
Pods not transversely jointed, without wart-like projections:
Pods spirally coiled
Pods not spirally coiled:
Pods dehiscentL (spp. 34-40)
Pods tardily dehiscent or indehiscent
Inflorescences greatly reduced, 2-4 flowers per head
Comprehensive key
a Flowers in spikes or spiciform racemes; rarely (in A. nuellifera subsp. detinens) the inflorescences short and ellipsoid but even then the axis clearly elongated:
Stipules spinescent, straight or only slightly curved; petiolar gland absent; stamen filaments united basally for ±1 mm; anthers eglandular even in bud; pods orange or chestnut- to reddish-brown, falcate or curled into a circular coil or variously twisted
Stipules not spinescent, plants armed with recurved prickles; petiolar gland usually present; stamen filaments free to the base; anthers glandular, at least in bud; pods not as above:
Prickles scattered irregularly along the internodes; stipules obliquely ovate, up to 12 × 7 mm; petiolar gland stalked; ovary densely pilose, on a long stipe that elevates it above the corolla; pods reddishbrown to purplish, usually distinctly acuminate at both ends, brittle; areole of seed a small central depression
Prickles confined to near the nodes, very rarely and in addition a few casually and irregularly scattered along the internodes; stipules ± linear, smaller than above; petiolar gland not stalked; ovary and pods not as above; areole horse-shoe shaped:
Prickles in threes, the two laterals curved upwards and the central one down, or else the prickles solitary, the two laterals being absent
Prickles in pairs near the nodes:
b Well developed leaves of mature shoots with 1-7 pinnae pairs:
Flowers shortly but distinctly nedicellate (nedicels (0.5) 0.75-1.5 mm long); inflorescence
ellipsoid to distinctly spicate; calyx cupular, 0,6-1 mm long, yellow, lobes often with a purplish tinge; leaflets 1-2(3) pairs per pinna; prickles of each pair often lying almost parallel to each other
Flowers sessile or subsessile (pedicel 0-0,3 mm long); inflorescence distinctly spicate; calyx 1,5-3,5 mm long (except in A. galpinii where it is shorter but red or purplish); leaflets 3 or more pairs per pinna (except in A. nigrescens); prickles spreading:
c Calyx glabrous, rarely with occasional scattered hairs:
Leaflets 1-2 (rarely 3) pairs per pinna, obovate or obliquely-obovate to broadly-elliptic or orbicular, (7)12-50 mm wide; leaves with 2-3(4) pinnae pairs; trunk and larger branches usually with scattered irregularly shaped knobs
Leaflets 3-35(45) pairs per pinna, 1-5 mm wide; leaves with 1-7 pinnae pairs:
Calyx cupular, 0,75-1,25 mm long, red or purplish; leaflets 12-35(45) pairs per pinna; pods 2,3-3,5 cm wide
Calyx 1,3-3,5 mm long, not red or purplish; leaflets 3-13 pairs per pinna; pods 1-2,4 cm wide:
Leaflets 3-8 pairs per pinna, elliptic, broadly elliptic or somewhat ovate, usually broadest at or below the middle, 2, 5-5 mm wide; young branchlets dark grey to brownish-black; prickles strongly recurved; occurs in the eastern Transvaal

- Leaflets (4)6-13 pairs per pinna, linear to linear-oblong or obovate, sometimes slightly falcate, 0,9-3,5(5) mm wide; young branchlets not as above; prickles often spreading laterally and almost at right angles to the stem; confined to S.W.A.:

 - Leaves with (2)3-6 pinnae pairs; pods 7,6-18 cm long, inconspicuously venose or venation coarse; slender tree branching from near the base, "broom-like"; young branchlets olive- to reddish-brown, bark often papery....6. A. montis-ust
- cc Calyx sparingly to densely puberulous:
 - Calyx cupular, 0,75-1,25 mm long, red or purplish; pods 2,3-3,5 cm wide..10. A. galpinii
 - Calyx 1,3-4,5 mm long, greenish-yellow to yellowish-white (sometimes with a distinct pinkish tinge in A. burkei); pods 1-2,4 cm wide:

 - Leaflets (10)12-30 pairs per pinna, 0,75-1,6(2,5) mm wide, linear to linear-oblong, straight or ±falcate; bracts not projecting beyond the buds; calyx 2-4,5 mm long, greenish-yellow; stamen filaments 6-10 mm long; pods with a fine close reticulate venation:
- bb Well developed leaves of mature shoots with 8 or more pinnae pairs:
 - Calyx cupular, 0,75-1,25 mm long, red or purplish; pods 2,3-3,5 cm wide......10. A. galpinii
 - Calyx 1,3-4,5 mm long, greenish-yellow to yellowish-white (sometimes with a distinct pinkish tinge in A. burkei); pods 1-2,4 cm wide:
 - Petiolar gland large, 1,5-4 × 1,5-3 mm, usually slightly flattened, discoid or oblong; petiole 0,5-4 cm long; rhachis glandular between the top 3-16 pinnae pairs.....11. A. polyacantha
 - Petiolar gland small to medium, $0.3-1.5 \times 0.1-0.7$ mm, rarely up to 2.2 mm long but then rhachis eglandular and petiole 0.3-1.3 cm long:

 - Leaf-rhachis glandular, with a gland at the junction of the top pinna pair only or at the junction of all or some of the pinna pairs; petiolar gland 0,3-1,5 mm long; petiole 0,4-4 cm long:

 - Leaflets 16-64 pairs per pinna, linear to linear-oblong, 0,5-2,3(3,8) mm wide; pinnae 8-38 pairs per leaf; pods usually puberulous or pubescent, glandular:

aa Flowers in round heads; very rarely inflorescences greatly reduced, apparently capitate with only 2-4 flowers per head:

- d Stipules not spinescent, plant armed with irregularly scattered recurved prickles:

 - Leaves with 8-30 pinnae pairs; leaflets 20-60 pairs per pinna, the lowest pair not reduced and bractlike, leaflets much smaller, <5.5 mm long and <2 mm wide:
- dd Stipules spinescent, in pairs at or near the nodes, spines either long and straight or short and strongly recurved or hooked, "ant-galls" sometimes present:

Inflorescences with \pm 35-200 flowers per head:

- e Flowers bright- or golden-yellow:

 - Leaves bipinnate but leaflets larger than above and quite distinct from one another, not laterally compressed as above:
 - f Involucel apical, rarely slightly below the capitulum; leaflets usually with the lateral nerves visible and somewhat raised beneath, rounded apically, (7)9-25 pairs per pinna:
 - Midrib and lateral nerves of leaflets visible and somewhat raised beneath; foliage light or dark green; leaflets 3-11,5 × 0,75-2,5 mm, glabrous throughout or with marginal cilia; leaf-rhachides, rhachillae and peduncles glabrous or sometimes sparingly pubescent:
 - ff Involucel basal to over halfway up the peduncle, seldom up to \$\frac{2}{2}ths way up the peduncle but then leaflets spinulose-mucronate apically; leaflets without raised lateral nerves beneath (except in A. swazica which has (3)4-6(7) pairs of leaflets):

Bark not greenish-yellow or lemon:

- Leaflets eglandular on the surface and margins, or at most with a few inconspicuous glands on the margin near the apex:

- All leaves with less than 13 pinnae pairs; leaflets fewer than 20(25) pairs per pinna, up to 5,5 mm wide; bark not corky; pods not as above:
 - g Leaflets (at least mostly) spinulose-mucronate apically; pinnae 1-7 pairs per leaf; leaflets 3-10 pairs per pinna; pods yellowish to reddish-brown, up to $7,5(9) \times 1,4$ cm, valves thin, usually glandular, viscid; small shrubs or slender trees:

 - Young branchlets glabrous or occasionally very sparingly pubescent but hairs not more than 0,5 mm long:

 - Involuced at or above the middle of the peduncle; leaves with (1)2-6 pinnae pairs:

 - Leaflets with lateral nerves inconspicuous on the lower surface:
 - gg Leaflets not spinulose-mucronate apically; pinnae 2-13 pairs per leaf; leaflets 6-36 pairs per pinna; pods rarely glandular and viscid; robust shrubs or trees:
- ee Flowers yellowish-white or cream, very rarely pale pink:
 - h Spines short and strongly recurved or hooked, often intermixed with some long straight spines or some enlarged swollen "ant-galls":

 - Pinnae (3)5-13 pairs per leaf; rhachides and rhachillae with spreading hairs; leaflets 6-26 pairs per pinna, margins glabrous or with spreading cilia; "ant-galls" or long straight spines sometimes present; pods contorted or spirally twisted or \pm straight:

 - Corolla tube 1,8-3,2 mm long; stamens up to 6,5 mm long; leaflets (1,5)2-5(7) × 0,5-1,5(2) mm; spines usually 2-3 mm in diameter basally; "ant-galls" sometimes present; pods straight or almost so:

- hh Spines straight or only slightly curved, never strongly recurved or hooked, long or short:
 - i Leaves with 1-14 pinnae pairs:

 - Involucel basal or in lower third of the peduncle, very seldom more than halfway up the peduncle but then peduncle and leaves not densely pubescent; pod valves not woody:
 - i Young branchlets glabrous or occasionally very sparingly puberulous:
 - Leaflets 0,5-1,25 mm wide; bark yellowish- or greyish-brown, flaking irregularly, papery, often revealing a greenish inner layer; peduncles usually with conspicuous sessile glands throughout; corolla usually pinkish-red; pods transversely segmented, each segment with a wart-like projection in the centre......32. A. kirkii
 - Leaflets mostly 1,5-3,5(8,5) mm wide; bark not as above; peduncles eglandular or glands present but inconspicuous; corolla not pinkish-red; pods not transversely segmented and without wart-like projections:
 - Leaf-rhachides, rhachillae and peduncles sparingly to densely pubescent..37. A. robusta Leaf-rhachides, rhachillae and peduncles glabrous:

 - Peduncle 1,2-2(2,5) cm long; calyx up to 1,5 mm long; corolla up to 2,5 mm long; leaves usually with 2-3(5) pinnae pairs; young branchlets slender, "cushions" poorly developed; spines typically slightly swollen and fused basally, pods usually falcate 0,6-1,1 cm wide......38. A. grandicornuta
 - ij Young branchlets sparingly to densely pubescent:

 - Hairs on young branchlets neither villous nor markedly golden, <1,5 mm long; peduncle (0,5)1,2-5,2 cm long; pods glabrous to densely grey-puberulous or -tomentellous, hairs <1,5 mm long:
 - Bark yellowish- or greyish-brown, flaking irregularly, papery, often revealing a greenish inner layer; leaflets 0,5-1,25 mm wide; peduncles usually with conspicuous sessile glands throughout; corolla usually pinkish-red; pods transversely segmented, each segment with a wart-like projection in the centre....32. A. kirkii
 - Bark not as above; leaflets (0,75)0,9-3 mm wide; peduncles eglandular or glands present but inconspicuous; corolla not pinkish-red; pods not as above:
 - Leaves with (2)4-14 pinnae pairs; rhachillae usually <2,5 cm long; leaflets mostly <1,5 mm wide; pods sparingly to densely grey-puberulous or -tomentellous, pendulous or erect, straight or falcate:
 - Leaves with 3-5 (rarely to 7) pinnae pairs; rhachillae usually 2,5-6 cm long; leaflets (1,25)1,5-3,5 mm wide; pods glabrous, straight or falcate...37. A. robusta
 - Well developed leaves with 15-44 pinnae pairs (reduced leaves with fewer pairs of pinnae often also present):

- Involucel apical or in upper half of the peduncle:
- Involucel basal or in lower half of the peduncle:

Key based on vegetative and floral characters

- Flowers in spikes or spiciform racemes; rarely (in A. nuellifera subsp. detinens) the inflorescences short and ellipsoid but even then the axis clearly elongate:
- Stipules not spinescent, plants armed with recurved prickles; petiolar gland usually present; stamen filaments free to the base; anthers glandular, at least in bud:
 - Prickles scattered irregularly along the internodes; stipules obliquely ovate, up to 12 × 7 mm; petiolar gland stalked; ovary densely pilose, on a long stipe that elevates it above the corolla . . 2. A. ataxacantha
 - Prickles confined to near the nodes, very rarely and in addition a few casually and irregularly scattered along the internodes; stipules ± linear, smaller than above; petiolar gland not stalked; ovary not as above:

 - Prickles in pairs near the nodes:

 - Flowers sessile or subsessile (pedicels 0-0,3 mm long); inflorescence distinctly spicate; calyx 1,5-3,5 mm long (except in A. galpinii where it is shorter but red or purplish); leaflets 3 or more pairs per pinna (except in A. nigrescens); prickles spreading:
 - b Well developed leaves of mature shoots with 1-7 pinnae pairs:
 - c Calyx glabrous, rarely with occasional scattered hairs:

 - Leaflets 3-13 pairs per pinna, 1-5 mm wide; leaves with 1-6 pinnae pairs:
 - Leaflets 3-8 pairs per pinna, elliptic, broadly elliptic or somewhat ovate, usually broadest at or below the middle, 2,5-5 mm wide; young branchlets dark grey- to brownish-black; prickles strongly recurved; occurs in the eastern Transvaal...7. A. welwitschii
 - Leaflets (4)6-13 pairs per pinna, linear to linear-oblong or obovate, sometimes slightly falcate, 0,9-3,5(5) mm wide; young branchlets not as above, prickles often spreading laterally and almost at right angles to the stem; confined to S.W.A.:

 - Leaves with (2)3-6 pinnae pairs; slender tree branching from near the base, "broom-like"; young branchlets olive- to reddish-brown; bark often papery. . 6. A. montis-usti
 - cc Calyx sparingly to densely puberulous:

 - Calyx 1,3-4,5 mm long, greenish-yellow to yellowish-white (sometimes with a distinct pinkish tinge in A. burkei):

- Leaflets (10)12-30 pairs per pinna, 0,75-1,6(2,5) mm wide, linear to linear-oblong, often ± falcate; bracts not projecting beyond the buds; calyx 2-4,5 mm long, greenish-yellow; stamen filaments 6-10 mm long:
- bb Well developed leaves of mature shoots with 8 or more pinnae pairs:

 - Calyx 1,3-4,5 mm long, greenish-yellow to yellowish-white (sometimes with a distinct pinkish tinge in A. burkei):
 - Petiolar gland large, 1,5-4 × 1,5-3 mm, usually slightly flattened, discoid or oblong; petiole 0,5-4 cm long; rhachis glandular between the top 3-16 pinnae pairs......
 -11. A. polyacantha
 - Petiolar gland small to medium, $0.3-1.5 \times 0.1-0.7$ mm, rarely up to 2.2 mm long but then rhachis eglandular and petiole 0.3-1.3 cm long:

 - Leaf-rhachis glandular, with a gland at the junction of the top pinna pair only or at the junction of all or some of the pinna pairs; petiolar gland 0, 3-1,5 mm long; petiole 0,4-4 cm long:

 - Leaflets 16-64 pairs per pinna, linear to linear-oblong, 0,5-2,3(3,8) mm wide; pinnae 8-38 pairs per leaf:
 - Leaf-rhachis (2,7)5-15(23) cm long; pinnae > 4 mm apart (rarely less), giving the leaf an "open" appearance; leaflets 0,7-2,3(3,8) mm wide......12. A. caffra
- aa Flowers in round heads or very rarely inflorescences greatly reduced, apparently capitate with only 2-4 flowers per head:
 - d Stipules not spinescent, plant armed with irregularly scattered recurved prickles:

 - Leaves with 8-30 pinnae pairs; leaflets 20-60 pairs per pinna, the lowest pair not reduced and bractlike, leaflets much smaller, <5,5 mm long and <2 mm wide:
 - dd Stipules spinescent, in pairs at or near the nodes, spines either long and straight or short and strongly recurved or hooked, "ant-galls" sometimes present:

Inflorescences with \pm 35-200 flowers per head:

- e Flowers bright- or golden-yellow:
 - Leaves bipinnate but the leaflets so tightly compressed laterally that the leaves appear simply pinnate, each pinna resembling a single linear, crenulate, densely grey-puberulous leaflet; leaflets 0,25-0,8 mm long, up to 0,5 mm wide; involucel apical......28. A. haematoxylon
 - Leaves bipinnate but the leaflets larger than above and quite distinct from one another, not laterally compressed as above:
 - f Involucel apical, rarely slightly below the capitulum; leaflets usually with the lateral nerves visible and somewhat raised beneath, rounded apically, (7)9-25 pairs per pinna:
 - Midrib and lateral nerves of leaflets visible and somewhat raised beneath; foliage light or dark green; leaflets $3-11,5 \times 0,75-2,5$ mm, glabrous throughout or with marginal cilia; leaf-rhachides, rhachillae and peduncles glabrous or sometimes sparingly pubescent:
 - ff Involucel basal to over halfway up the peduncle, seldom up to 4/5ths way up the peduncle but then the leaflets spinulose-mucronate apically; leaflets without raised lateral nerves beneath (except in A. swazica which has (3)4-6(7) pairs of leaflets):

 - Bark not greenish-yellow or lemon:

 - Leaflets eglandular on the surface and margins, or at most with a few inconspicuous glands on the margin near the apex:

 - All leaves with less than 13 pinnae pairs; leaflets fewer than 25 pairs per pinna, up to 5,5 mm wide; bark not corky:
 - g Leaflets (at least mostly) spinulose-mucronate apically; pinnae 1-7 pairs per leaf; leaflets 3-10 pairs per pinna; young branchlets often glutinous; small shrubs or slender trees:
 - Young branchlets densely tomentose with spreading whitish hairs 0,75-2 mm long......24. A. permixta
 - Young branchlets glabrous or occasionally very sparingly pubescent but hairs not more than 0,5 mm long:

 - Involucel at or above the middle of the peduncle; leaves with (1)2-6 pinnae pairs:

 - Leaflets with lateral nerves inconspicuous on the lower surface:

- gg Leaflets not spinulose-mucronate apically; pinnae 2-13 pairs per leaf; leaflets 6-36 pairs per pinna; young branchlets not glutinous; robust shrubs or trees:
 - Young branchlets sparingly to densely pubescent, rarely subglabrous; leaflets 12-27(36) pairs per pinna, 0,5-1,5 mm wide, linear-oblong; inflorescences solitary or fascicled, usually terminal; peduncle sparingly to densely pubescent; spines often deflexed; tree, usually with a somewhat flattened crown 30. A. nilotica
- ee Flowers yellowish-white or cream, very rarely pale pink:
 - h Spines short and strongly recurved or hooked, often intermixed with some long straight spines or some enlarged swollen "ant-galls":

 - Pinnae (3)5-13 pairs per leaf; rhachides and rhachillae with spreading hairs; leaflets 6-26 pairs per pinna, margins glabrous or with spreading cilia; "ant-galls" or long straight spines sometimes present:

 - Corolla tube 1,8-3,2 cm long; stamens up to 6,5 cm long; leaf-rhachides 1-4,2 cm long; rhachillae 0,8-2,8 cm long; leaflets (1,5)2-5(7) × 0,5-1,5(2) mm; spines usually 2-3 mm in diameter basally; "ant-galls" sometimes present:
 - hh Spines straight or only slightly curved, never strongly recurved or hooked, long or short: i Leaves with 1-14 pinnae pairs:

 - Involucel basal or in lower third of the peduncle, very seldom more than halfway up the peduncle but then peduncle and leaves not densely pubescent:
 - j Young branchlets glabrous or occasionally very sparingly puberulous:

 - Leaflets mostly 1,5-3,5(8,5) mm wide; bark not as above; peduncles eglandular or glands present but inconspicuous; corolla not pinkish-red:
 - Leaf-rhachides, rhachillae and peduncles sparingly to densely pubescent..37. A. robusta Leaf-rhachides, rhachillae and peduncles glabrous:
 - jj Young branchlets sparingly to densely pubescent:

- Hairs on young branchlets neither villous nor markedly golden, <1,5 mm long; peduncle (0,5)1,2-5,2 cm long:
 - Bark yellowish-brown or greyish-brown, flaking irregularly, papery, often revealing a greenish inner layer; leaflets 0,5-1,25 mm wide; peduncles usually with conspicuous sessile glands throughout; corolla usually pinkish-red.....32. A. kirki
 - Bark not as above; leaflets (0,75)1-3,5 mm wide; peduncles eglandular or glands present but inconspicuous; corolla not pinkish-red:
 - Leaves with (2)4-14 pinnae pairs; rhachillae usually <2,5 cm long; leaflets mostly <1.5 mm wide; tree up to 10 m high or a shrub:
 - Leaves with 3-5 (rarely to 7) pinnae pairs; rhachillae usually 2-5,6 cm long; leaflets (1,25)1,5-3,5 mm wide; tree to 20 m high with ascending branches...37. A. robusta
- ii Well developed leaves with 15-44 pinnae pairs (reduced leaves with fewer pairs of pinnae often also present):
 - Involucel apical or in upper half of the peduncle:
 - Calyx short, up to 1,2 mm long, shorter than the projecting part of the corolla; flowers white or pale pink; young branchlets sparingly to densely puberulous....39. A. arenaria
 - Calyx > 1,5 mm long, longer than the projecting part of the corolla; flowers pale yellowish-white; young branchlets usually densely golden-pubescent............41. A. sieberana
 - Involucel basal or in lower half of the peduncle:

Key based on vegetative and pod characters

- a Stipules not spinescent, plants armed with recurved prickles:
 - b Prickles irregularly scattered along the internodes:

 - Leaves with 8-30 pinnae pairs; leaflets 20-60 pairs per pinna, the lowest pair not reduced and bractlike, leaflets much smaller, <5,5 mm long and <2 mm wide:

 - Pods not as above; areole large, elliptic, conforming to the outline of the seed; stipules linear-oblong, up to 5×2 mm; petiolar gland not stalked:
 - bb Prickles confined to near the nodes, very rarely and in addition a few casually and irregularly scattered along the internodes:

Prickles in pairs near the nodes:

c Well developed leaves with 1-7 pinnae pairs:

d Leaflets 1-2 (rarely 3) pairs per pinna:

Pods olive- to yellowish-brown, 2,5-8(9,3) cm long, valves somewhat papery, with a conspicuous closely reticulate venation; prickles of each pair often lying almost parallel to

Pods dark brown or reddish-brown to blackish, (4)6-18 cm long, valves not papery, without a closely reticulate venation; prickles spreading; usually a fairly large tree;

Leaflets > 5.5 mm wide, asymmetric basally, obovate, obovate-orbicular to broadly obovateelliptic, usually sparingly to densely appressed-pubescent above and/or below:

Leaves with 2-3(4) pinnae pairs; leaflets (7)12-50 mm wide; remnant of calyx glabrous; trunk and larger branches usually with scattered irregularly shaped knobs 8. A. nigrescens

Leaves with 2-7 pinnae pairs; leaflets 5,5-13 mm wide; remnant of calvx sparingly to densely pubescent; trunk and large branches usually without knobs.....9. A. burkei

Leaflets 2,5-5 mm wide, almost symmetric basally except for the terminal ones, elliptic or broadly elliptic, sometimes somewhat ovate, usually glabrous throughout...7. A. welwitschii dd Leaflets 4-45 pairs per pinna:

Pods with a fine closely reticulate venation, yellowish-brown or brown, up to 1,8 cm wide (rarely wider) and up to 13.5 cm long:

Leaves with 1 or 2 pinnae pairs; leaflets 1,2-2,8(3,5) mm wide; low shrub with several slender erect branches which tend to droop apically or a slender tree; young branchlets white to reddish-brown or purple, often as though whitewashed over a purplish back-

Leaves with 3-7 pinnae pairs; leaflets 0,75-2(2,8) mm wide; much branched shrub or tree;

Petiole (0,8)1,2-2,5(4) cm long; petiolar gland 0,3-0,7(1) mm long, usually slightly raised or stalked; leaflets often \pm falcate, mostly 5-10 mm long; leaf-rhachis usually with a gland at the junction of some of the pinnae pairs or the top pinna pair only, occasio-

Petiole 0,3-1,3 cm long; petiolar gland 0,8-2,2 mm long, flattened, elliptic or oval; leaflets straight, mostly <5 mm long; leaf-rhachis eglandular.......14. A. fleckii

Pods without a fine close reticulate venation, inconspicuously venose or venation coarse, olive- or reddish- to purplish-brown or blackish, 1-3,5 cm wide and up to 28 cm long:

Pods 2,3-3,5 cm wide, 11,5-28 cm long, reddish to purplish-brown when mature, valves

Pods 1-2,4 cm wide, up to 11(16,9) cm long, brown or reddish-brown to blackish; leaflets 4-13(15) pairs per pinna:

Leaf-rhachides and rhachillae with spreading hairs; leaflets usually with marginal cilia and often appressed-pubescent beneath, typically with a basal tuft of hairs to one side

Leaf-rhachides, rhachillae and leaflets glabrous throughout; leaflets 0,9-5 mm wide:

Leaflets 2.5-5 mm wide; elliptic or broadly elliptic, sometimes somewhat oyate; prickles strongly recurved; young branchlets dark grey or reddish-brown to blackish; usually a fairly large tree with a rounded or spreading crown; confined (in our area) to the

Leaflets 0, 9-3(5) mm wide, linear-oblong to obovate, sometimes slightly falcate; prickles ± straight or very slightly curved, spreading laterally and almost at right angles to

cc Well developed leaves with 8 or more pinnae pairs:

Pods 2,3-3,5 cm wide, reddish- to purplish-brown when mature, valves thinly woody, brittle,

Pods 0,7-2,2 cm wide (yery rarely to 2,7 cm wide), yellowish-brown, brown or reddish-brown to blackish:

Petiolar gland large, 1,5-4 × 1,5-3 mm, usually slightly flattened, discoid or oblong; petiole 0,5-4 cm long; rhachis with a gland at the junction of the top 3-16 pinnae pairs......

Petiolar gland small to medium, 0,3-1,5 \times 0,1-0,7 mm, rarely up to 2,2 mm long but then rhachis eglandular and petiole 0,3-1,3 cm long:

Leaf-rhachis glandular, with a gland at the junction of each pinna pair, at the junction of some or the top pinna pair only; petiolar gland 0,3-1,5 mm long; petiole 0,4-4 cm long:

Leaflets 18-64 pairs per pinna; pinnae 8-38 pairs per leaf; leaflets linear to linear-oblong, 0,5-2,3(3,8) mm wide; pods brown or olive-brown, usually puberulous, glandular:

aa Stipules spinescent, spines in pairs at or near the nodes:

e Spines short and strongly recurved or hooked, usually intermixed with some long straight spines or some enlarged swollen "ant-galls":

Pods straight or almost so, not contorted or spirally twisted:

Valves of pods coriaceous, not markedly thickened, brown or reddish-brown, subglabrous to finely puberulous, with fine longitudinal venation, dehiscent; pods pendulous:

ee Spines straight or only slightly curved, never strongly recurved or hooked, long or short:

Pods indehiscent and thin-valved (except sometimes for tubercles in the centre of the segments), jointed and breaking up transversely, ±transversely or net-veined, glabrous except usually for sessile glands; bark on trunk usually yellow to green, sometimes grey or brown, powdery or papery and peeling:

Pods dehiscent or indehiscent, if indehiscent then the valves markedly thickened, woody or pulpy in texture, not venose and glandular as above:

f Valves of pods markedly thickened, woody or pulpy in texture, pods indehiscent or slowly dehiscent:

Pods not as above; petiolar gland usually present:

Pods not as above:

Pods glabrous or very sparingly pubescent:

Pods glabrous, subterete and turgid, 0,9-1,5 cm in diameter, dark brown to blackish, finely longitudinally striate; young branchlets glabrous or nearly so.....48. A. farnesiana

- Pods ± densely puberulous, pubescent, tomentellous or villous:
 - g Indumentum on pods short, the hairs < 1 mm long:
 - h Pods densely and continuously grey-tomentellous, often with numerous minute reddish-brown glands scattered in amongst the hairs:
 - Pods falcate, semi-lunate, suborbicular or curled into an almost complete circle, rarely straightish, usually persistently greyish, indehiscent, pendulous:

 - Leaves bipinnate but the leaflets larger than above and quite distinct from one another, not laterally compressed as above:
 - hh Pods not densely and continuously grey-tomentellous:
 - gg Indumentum on pods long, the hairs spreading, 2-4 mm long; indumentum on branchlets spreading, golden, becoming greyish with age; obconical shrub to 3 m...

 43. A. stuhlmannii
- ff Valves of pods membranous to subcoriaceous or coriaceous, not markedly thickened, dehiscent:
- i Well developed leaves of mature shoots with 13-45 pinnae pairs:
 - Leaflets glandular-punctate, with conspicuous glands on the lower surface and on the margins, the margins appearing crenulate-glandular; pods \pm falcate or curled into an almost complete circle, \pm moniliform and constricted between the seeds, glandular, viscid. . 25. A. borleae
 - Leaflets not glandular-punctate; pods not as above:
 - Pods 0,5-0,8 cm wide, straightish to falcate; young branchlets glabrous to densely puberulous:
 - Pods yellowish-brown or sometimes reddish-brown, straightish to slightly falcate; bark yellowish-brown, soft, corky; occurs in Transvaal, Swaziland and Natal...26. A. davyi
 - ii Well developed leaves of mature shoots with 1-12 (rarely 13) pinnae pairs:
 - Leaflets glandular-punctate, with conspicuous glands on the lower surface and on the margins, the margins appearing crenulate-glandular; pods \pm falcate or curled into an almost complete circle, \pm moniliform and constricted between the seeds, glandular, viscid....25. A. borleae
 - Leaflets not glandular-punctate, or at most with a few inconspicuous glands on the margin near the apex:
 - *j* Leaflets (at least mostly) spinulose-mucronate apically; pinnae 1-7 pairs per leaf; leaflets 3-10 pairs per pinna; pods yellowish- to reddish-brown, up to $7,5(9) \times 1,4$ cm, valves thin, usually glandular, viscid; small shrubs or slender trees:

| Young branchlets glabrous or occasionally very sparingly pubescent, but hairs not more than 0,5 mm long: |
|--|
| Leaflets with lateral nerves conspicuous and somewhat raised on the lower surface |
| Leaflets with inconspicuous lateral nerves on the lower surface: |
| Rhizomatous shrub 0,5-1,2(2,4) m high; leaflets 0,9-1,5 mm wide, 3-9 pairs per pinna; spines slender, up to 1,5 mm in diameter basally |
| Small tree or slender shrub, not rhizomatous; leaflets (0,8)1,5-4,5 mm wide, 3-6 pairs per pinna; spines sometimes swollen basally: |
| Leaves usually with only 1 pinna pair, rarely 2-3 pairs; pods (0,6)0,9-1,3 cm wide, with numerous dark glands scattered over the surface; spines not swollen basally |
| Leaves with (1)2-4(6) pinna pairs; pods 0, 4-0,9 cm wide, eglandular or almost so; spines frequently enlarged and swollen basally; bark peeling off in strips |
| jj Leaflets not spinulose-mucronate apically; pinnae 1-12(13) pairs per leaf; leaflets 2-24 pairs per pinna; pods rarely viscid: |
| Pods glabrous or subglabrous: |
| Margins of pods usually entire, occasionally slightly constricted between some of the seeds; valves thinly woody; seeds 6-11 × 5-8,5 mm; leaves with 2-5(6) pinnae pairs: |
| Pods 0,7-1,1 cm wide, falcate; leaves usually with 2-3 pinnae pairs, leaf-rhachides glabrous; spines typically slightly swollen and fused basally; young branchlets slender, "cushions" poorly developed at the nodes |
| Pods 1,2-2,4(3) cm wide, ± straight to falcate; leaves usually with 3-6 pinnae pairs; leaf-rhachides glabrous to densely pubescent; spines not swollen; young branchlets robust, usually with well developed "cushions" at the nodes37. A. robusta |
| Margins of pods invariably distinctly constricted between the seeds, regularly or irregularly so, often \pm moniliform, valves not thinly woody; seeds 3,5-6,5(9) \times 2-5(7) mm; leaves with 2-13 pinnae pairs |
| Pods sparingly to densely grey-puberulous or -tomentellous: |
| Pods straight, 2,6-3,2 cm long; dwarf shrub up to 0,6 m high; leaves with 1 pinna pair; 2-4 pairs of leaflets per pinna |
| Pods curved or falcate, longer than above; robust shrub or large tree; leaves with 3-12 pinnae pairs; > 4 pairs of leaflets per pinna: |
| Pods falcate; seeds \pm quadrate, 9-12 \times 5-7 mm; young branchlets with well developed "cushions" at the nodes; usually a tree with an irregularly flattened crown |
| Pods slightly curved to ±falcate; seeds oblong-elliptic, up to 8 × 6 mm; "cushions" on young branchlets poorly developed or absent; shrub or tree, crown often irregularly rounded |
| Naturalized and cultivated exotic species |
| Leaves bipinnate: |
| Plant armed with paired stipular spines |
| Plant unarmed; |
| Leaflets large, mostly 2-6 cm long, 0,4-1 cm wide, lanceolate to linear-lanceolate, often somewhat falcate; leaves large, 30-40 cm long |
| Leaflets 1,5–15 mm long, < 2 mm wide; leaves smaller than above: |
| Leaves with 1-4 pinnae pairs: |
| |
| Petiole and rhachis together < 2,5 cm long; pinnae crowded, glaucous; midrib ± central in the leaflet or inconspicuous; inflorescence an axillary raceme or panicle, longer than the leaves |
| 52. A. baileyana |
| Petiole and rhachis together > 3 cm long; pinnae neither crowded nor glaucous; midrib almost marginal throughout the length of the leaflet, pubescent; inflorescences axillary, solitary, paired or fascicled |

| Leaves with (5)8-26 pinnae pairs: |
|---|
| Leaflets 1,5-5,5 mm long: |
| Leaf-rhachis with a gland at the junction of each pinna pair and usually also with additional glands between the pinnae pairs; pods ± moniliform |
| Leaf-rhachis with a gland at the junction of all or most pairs of pinnae but not between the pinnae pairs; pods not or only slightly moniliform |
| Leaflets 6–15 mm long: |
| Young branchlets prominently angled, sometimes with wing-like ridges 1-2 mm high; pinnae up to 15 pairs per leaf; leaflets 6-15 × 0,3-0,75 mm, midrib ± central, glabrous; inflorescence an axillary raceme or panicle |
| Young branchlets not prominently angled; pinnae up to 7 pairs per leaf; leaflets 6-9 × 0,8-1,25(2) mm, midrib almost marginal throughout its length and pubescent; inflorescences axillary, solitary, paired or fascicled |
| Leaves apparently simple, modified to phyllodes by dilation of the petiole and rhachis: |
| Plant armed with stipular spines |
| Phyllodes each with one main longitudinal nerve: |
| Phyllodes < 4cm long, 0,5-2 cm wide, seldom up to 4,5 cm long but then < 0,5 mm wide and linear-
oblong: |
| Phyllodes 2-5 mm wide, linear-oblong, the margins typically densely ciliate64. A. fimbriata |
| Phyllodes 6-20 mm wide, not linear-oblong: |
| Young branchlets and phyllodes densely grey-pubescent, especially when young; phyllodes ovate to elliptic or elliptic-oblong, mostly 10-20 mm wide; pods 1,5-2 cm wide |
| |
| Young branchlets and phyllodes glabrous; phyllodes obliquely obovate-lanceolate to ovate-triangular, 6-11 mm wide; pods 5-7 mm wide |
| Phyllodes 5 –22 cm long: |
| Phyllodes 1,5–3 mm wide |
| Phyllodes > 5 mm wide: |
| Phyllodes ± straight or sometimes slightly falcate, linear-lanceolate to linear-oblong or oblanceolate, mostly 0,6-1,4 cm wide: |
| Flower-heads > 6,5 mm in diameter; peduncles 6-22 mm long; naturalized species55. A. saligno |
| Flower-heads < 6 mm in diameter; peduncles 3–6 mm long; cultivated only63. A. retinodes |
| Phyllodes distinctly falcate, obovate-lanceolate, mostly 1,3–3 cm wide56. A. pycnantha |
| Phyllodes each with 2–7 or more longitudinal nerves: |
| Flowers in spikes: |
| Pods straight or slightly curved, glabrous; inflorescence axis glabrous or almost so; naturalized species |
| Pods variously coiled or twisted, pubescent; inflorescence axis pubescent; cultivated only |
| Flowers in round heads: |
| Phyllodes < 4 mm wide: |
| |
| Phyllodes green; inflorescences axillary, solitary or paired, rarely fascicled; pods 3-3,5 mm wide, sparingly to densely pubescent, margins not winged |
| Phyllodes greyish or glaucous; inflorescence a short axillary raceme; pods 8-18 mm wide; the margins distinctly winged |
| Phyllodes > 5 mm wide: |
| Phyllodes 0,6-2,5 cm wide, green, longitudinal nerves conspicuous; pods falcate or variously coiled or spirally twisted; margins not winged, naturalized species: |
| Flowers bright yellow; petals free; phyllodes usually±straight, sometimes slightly falcate, with anastomosing longitudinal venation between the main longitudinal nerves 58. A. cyclops |
| Flowers pale yellowish-white; petals united to above the middle; phyllodes usually ± falcate, sometimes±straight, with conspicuous reticulate venation between the main longitudinal nerves |
| Phyllodes 0,5-0,9 cm wide, greyish or glaucous, longitudinal nerves not prominent; pods straight or slightly curved, the margins distinctly winged; cultivated only68. A. pendula |

Faidherbia albida (Del.) A. Chev. in Rev. Bot. Appl. Agric. Trop. 14: 876 (1934); Aubrév., Fl. For. Soud. Guin. 280, t.51/3, t.53/6 (1950); Gilbert & Boutique in F.C.B. 3: 169 (1952). Type as for Acacia albida Del.

Tree to 30 m high; trunk to 2 m diam.; crown rounded, branches spreading and frequently drooping to the ground in mature trees, young plants often irregularly branched and spindle-like. Bark dark brown to greenish-grey or ashen, rough; young branchlets greenish-white or ashen, subglabrous to pubescent. Stipules spinescent, in pairs, up to 3.2 cm long, straight or slightly curved, greenish-white to light grey-brown, tips often reddish-brown when young; no prickles below the stipules. Leaves: petiole 0, 5-3,7 cm long, adaxial gland absent; rhachis (1,3) 3-6(7.5) cm long, subglabrous or puberulous, with a single conspicuous gland at the junction of each of the 2(3)-10 pairs of pinnae; rhachillae (1,5)2,5-5,5(8,9) cm long; leaflets grey-green, 6-23 pairs per pinna, $(2,\bar{5})4,5-9(1\bar{3}) \times 0,75-3(5)$ mm, linear or linear-oblong to slightly obovate-oblong, apex rounded to subacute or mucronate, margin with or without white ciliolate hairs, glabrous or sparingly to densely appressedpubescent ab- and/or adaxially. Inflorescences spicate, usually produced singly in the axil of a leaf, collectively forming a terminal panicle or raceme. Flowers yellowish-white to pale cream, sessile or to 0,5(2) mm pedicellate; spikes 3,5-15,7 cm long; peduncles (0,8) 2-4(6,3) cm long, subglabrous to pubescent. Calyx campanulate, glabrous to pubescent, tube 0,5-1,8 mm long, lobes 0,3-0,7 mm long. Corolla often a delicate pink inside basally, tube 0,8-2,5 mm long, lobes divided almost to the base, up to 3 mm long, glabrous to pubescent. Stamen-filaments 4-6 mm long, shortly connate basally for ± 1 mm; anthers 0,2-0,4 mm across, eglandular even in bud. Ovary 0,7-1,4 mm long, shortly stipitate, pilose; style glabrous or subglabrous. Pods bright orange to reddishbrown, falcate or curled into a circular coil or variously twisted, indehiscent, thick, $6-35 \times (1,4)2-3,5(4,5)$ cm, glabrous or very rarely puberulous. Seeds light to dark brown, 9-12 × 4-8 mm, elliptic-lenticular; areole $7-9 \times 4-6$ mm, elliptic-lenticular.

Widespread in tropical and subtropical Africa from Senegal, Gambia and Egypt southwards to South West Africa, Botswana, the Transvaal and

Natal (Tongaland). Found usually on alluvial floodplains, in riverine fringing vegetation, on the margins of pans or swamps or, in more arid localities, along dry watercourses or where a fairly high water table exists.

S.W.A.—1712 (Posto Velho): bank of Kunene River, Story 5803. 1713 (Swartbooisdrift): Ombazu, 51,2 km N. of Ohopoho on road to Swartbooisdrift, De Winter & Leistner 5895. 1724 (Katima Mulilo): Lisikili, 25 km E. of Katima Mulilo, Codd 7100. 1913 (Sesfontein): near Sesfontein, Hall 497. 2014 (Welwitschia): bed of Ugab River at Sorris-Sorris, near Brandberg, De Winter 3151. 2115 (Karibib): Usakos, Pole Evans sub PRE 19303. 2216 (Otjimbingwe): Kuiseb, Strey 2635. Grid ref. unknown: bed of the Khan River, Pillans 5919 (BOL); Damaraland, Marloth 1194 (BOL, GRA)—the labels on these two specimens bear different localities in Damaraland.

TRANSVAAL.—2230 (Messina): Messina, Pole Evans sub PRE 13118. 2231 (Pafuri): Kruger National Park, Makuleka, Lang sub TRV 32262. 2329 (Pietersburg): 32 km N. of Pietersburg on Kalkbank road, Story 1557. 2330 (Tzaneen): 80 km N. of Gravelotte station, on bank of Great Letaba River, Galpin 13533—the precise locality of this specimen is uncertain because the Great Letaba River is only 32 km north of Gravelotte by road; the Small Letaba River, however, is ± 80 km north of Gravelotte. 2428 (Nylstroom): 14,4 km N.W. of Potgietersrust on road to Zaaiplaats, Codd 4185. 2531 (Komatipoort): Lebombo flats near Swaziland border, Keet 1495. Grid ref. unknown: northern Soutpansberg, Sand River, Legat 49; N.E. Soutpansberg, Nwanedzi River, Pole Evans 191; junction of Crocodile and Magalakwin rivers, Pole Evans 3968.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, Usutu floodplain, *Ross* 699. 2732 (Ubombo): 9,6 km N. of Otoboteni, P.O. at Mfongozi, *Codd* 2085.

A. albida displays a number of unusual characters, some of which are peculiar to this species alone amongst the African acacias. A. albida differs in having eglandular petioles but a gland on the rhachis at the junction of each pair of pinnae, stamenflaments which are shortly connate basally, large anthers which are eglandular even when in bud, and typically falcate or spirally coiled indehiscent pods. However, each of these characters may be found in other species of Acacia although in no other species are all of these characters associated together. Chevalier in Rev. Bot. Appl. Agric. Trop. 14: 876 (1934) considered the species to be sufficiently distinct from all others to transfer it to the monotypic genus Faidherbia.

A. albida is not closely related to any of the other African species and there are the above differences, coupled with differences in pollen morphology and seedling development, to suggest that the species should be excluded from Acacia. However, although differing from the other African acacias, A. albida does nevertheless share many characters in common with them. In deciding whether or not the species should be excluded from Acacia, it depends upon whether the emphasis is placed on the differences or on the similarities. It may ultimately prove better to transfer the species to Faidherbia.

Another unusual feature of A. albida is the tendency for plants to sometimes shed their leaves at the commencement of the rainy season and remain leafless throughout the summer, finally producing new leaves towards the beginning of the dry season.

A. albida, popularly known as the "ana tree" or "anaboom", is one of our largest acacias. A fine group of trees north-west of Potgietersrust on the road to Zaaiplaats in the Transvaal is protected under the National and Historical Monuments Act. These trees have been referred to as "Livingstone's Trees" but it seems very unlikely that Livingstone ever saw them.

The pods of A. albida are regarded as a valuable fodder and are relished by game and domestic stock.

In our area A. albida has the leaflets \pm pubescent on the surface and \pm pubescent young branchlets, inflorescence-axes, calyees and (often) corollas, thus corresponding to Race B as defined by Brenan in F.T.E.A. Legum.-Mimos. : 79 (1959). Race A is not known in our area.

Type: Transvaal, Letaba Distr., Magoebas Kloof, Houtboschberg, Burtt Davy 5231 (K, holo.!; BOL!).

Scandent shrub up to 15 m high, often with many stems arising from a common base, a non-climbing shrub or occasionally a tree up to 10 m high, crown often slightly rounded in arborescent forms; trunk to 0,5 m diam. Bark pale to dark yellowish- or greybrown, rough, slightly fissured, sometimes flaking; young branchlets pale yellowish- or grey- to reddish-brown, sparingly to densely pubescent, indumentum frequently slightly golden. Stipules not spinescent, in pairs above the nodes, obliquely ovate (rarely almost linear), up to 12×7 mm, soon deciduous. Prickles scattered along the internodes, usually strongly recurved, reddish-brown to purplish, often broad-based, up to 15 mm long. Leaves: petiole (0,4)1-2(3,4) cm long, adaxial gland usually present (sometimes two), variable in position, usually stalked, up to 2 mm high; rhachis (2,3)6-12(16,5) cm long, sparingly to densely pubescent, rarely subglabrous, with or without recurved prickles abaxially, a gland often present at the junction of the top pair of pinna only or between the top 1-5 and occasionally the lowest 1-3 pairs; pinnae (6)8-20(29) pairs; rhachillae (0,9)2,6-4,2(7,3) cm long; leaflets 19-62 pairs per pinna, 2-6,9 \times 0,5-1,3 mm, linear to linear-oblong, often slightly falcate, apex obtuse to acute, margins with or without ciliate hairs, glabrous abaxially or appressed-pubescent with a tendency for an apical and/or basal tuft. Inflorescences spicate, fascicled or crowded into an irregular terminal raceme, occasionally Flowers yellowish-white, pedicellate or appearing sessile; spikes 2,2-11,5 cm long; peduncles 0,3-2,5 cm long, sparingly to densely pubescent. Calyx cupular, glabrous

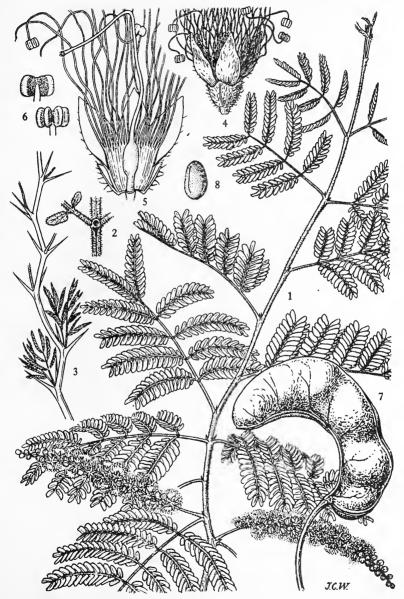

FIG. 7.—Acacia albida. 1, flowering branch, × \(\frac{2}{3}\); 2, part of leaf-rhachis showing gland, × 4; both from Robinson 269; 3, juvenile shoot, × \(\frac{2}{3}\), Loveniore 68; 4, flower, × 6; 5, flower opened out to show ovary, × 8; 6, anthers, × 20, all from Robinson 269; 7, pod, × \(\frac{2}{3}\), Meikle s.n.; 8, seed, × 1, Kirk s.n. to sparingly pubescent, usually $\frac{1}{4}$ as long as corolla, tube 0,6-1,7 mm long, lobes 0,2-0,6 mm long. *Corolla* campanulate, glabrous to sparingly pubescent, tube 1,4-2,2 mm long, lobes up to 0,8 mm long. Stamenfilaments free, up to 6 mm long; anthers 0,15 mm across, with a deciduous apical gland. Ovary densely pubescent, 0,6-1,4 mm long, on a stipe longer than itself. Pods reddish- or purplish-brown, $5,3-20,4 \times 0,9-2,4$ cm, linear-oblong, straight, very acuminate at both ends or merely acute, longitudinally dehiscent, brittle, umbonate over the seeds, glabrous or subglabrous. Seeds olive-brown, subcircular-lenticular, 6-9 mm in diam... compressed; areole central, small, 2,5-3 mm in diam., obscure.

Widespread in tropical and subtropical Africa from Senegal in the west to the Sudan Republic in the north-east, southwards to South West Africa, Botswana, the Transvaal, Swaziland, Natal and the Eastern Cape Province. Occurs in riverine fringing vegetation, on forest margins, in forest clearings, as a component of mesophytic scrub in shaded kloofs and ravines, in dry river valley scrub and thornveld, on boulder-strewn slopes or, occasionally, in open grassland. Often forms dense impenetrable thickets.

Variety australis was held by Burtt Davy to differ from typical A. ataxacantha in having larger leaves with more numerous pinnae and leaflet pairs and leaflets "thinly pilose with scattered, appressed hairs, especially on the margins." However, the abundant material collected in recent years contains so many intermediates between var. australis and typical A. ataxacantha that it is no longer considered desirable to uphold var. australis. Despite this, there is an overall tendency for an increase in the degree of pubescence of the young branchlets, leaf-rhachides, leaflets and inflorescence-axes in the southern part of the species range in Africa.

Mention must be made of some atypical specimens from the Kaokoveld in South West Africa, for example, De Winter & Leistner 5494, Merxmuller & Giess 1409 (K, M) and Walter 1/260 (M). These specimens differ from more typical A. ataxacantha in our area in lacking stalked petiolar glands, in having few pinnae pairs, glabrous or very sparingly pubescent leaf-rhachides, and short inflorescences. It is thought that these differences may be the response to drier conditions or to some edaphic factor. For the present it is not intended to accord these specimens any formal taxonomic recognition.

- A. ataxacantha has in the past often been confused with A. caffra (Thunb.) Willd. A. caffra is usually easily separated from A. ataxacantha in having prickles in pairs near the nodes, linear stipules, sessile petiolar glands, the calyx much longer in proportion to the corolla, a glabrous shortly stipitate ovary and brownish pods. Very occasionally A. caffra may have a few scattered prickles in addition to the normal paired prickles and then confusion is perhaps possible. However, the other characters enumerated above should enable the two species to be distinguished without much difficulty.
- 3. Acacia senegal (L.) Willd., Sp. Pl. 4: 1077 (1806) pro parte excl. syn. fere omnibus; DC., Prodr. 2: 459 (1825); Benth. in Trans. Linn. Soc. Lond. 30: 516 (1875); Hutch. & Dalz. in F.W.T.A., ed. 1, 1: 361 (1928) pro parte; Bak.f., Leg. Trop. Afr. 3: 827 (1930) pro majore parte; Burtt Davy, Fl. Transv. 2: 337 (1932); Codd, Trees

& Shrubs Kruger Nat. Park 50 (1951); Gilbert & Boutique in F.C.B. 3: 149 (1952); Young in Candollea 15: 93 (1955); Torre in C.F.A. 2: 273 (1956); Keay in F.W.T.A., ed. 2, 1: 498, fig. 159 (1958); Brenan in F.T.E.A. Mimosa senegal L., Sp. Pl. 1:521 (1753) excl. syn. fere omnibus. Type uncertain, presumably a specimen collected by Adanson in Senegal.

Shrub or tree up to 8 m high (in our area) with a slightly rounded or flattened and somewhat spreading crown, or a slender spindly tree with irregular virgate branches. Bark yellowish- or greyish-brown to purplish-black, rough, often corky and flaking off or smooth, papery and peeling off in strips; young branchlets yellowish- or greyishbrown to purplish-black, sometimes as though whitewashed over a purplish background, smooth or rough and flaking minutely or exfoliating to reveal a yellow inner layer, glabrous to densely pubescent. Stipules not spinescent, in pairs, linear, up to 5 mm long, soon deciduous. Prickles just below the nodes, up to 9 mm long, typically in threes, the central one hooked downwards and the two laterals ± curved upwards, or else solitary, the laterals being absent. Leaves: petiole 0,2-2 cm long, sparingly to densely pubescent, rarely subglabrous, adaxial gland usually present, sometimes two, variable in position, 0,5-0,75 mm in diam.; rhachis 0,7-6,9 cm long, sparingly to densely pubescent, lower surface with or without recurved prickles, with a gland at the junction of the top 1-5 pinnae pairs, between each pair or absent from some; pinnae (2)3-8(12) pairs; rhachillae 0,5-2,5 cm long, sparingly to densely pubescent; leaflets 7-25 pairs per pinna, $1-7 \times 0, 5-1, 75$ mm, linear to linearor elliptic-oblong, apex obtuse to subacute. margins with or without cilia, sparingly appressed-pubescent above and beneath or entirely glabrous, lateral nerves invisible beneath or sometimes \pm prominent. Inflorescences spicate, solitary or fascicled. Flowers yellowish-white, sessile; spikes 1,5-10 cm

long, axis glabrons to densely pubescent; peduncle 0,1-2 cm long. Calyx sometimes tinged with pink, glabrous to somewhat pubescent, tube 0,9-2,6 mm long, lobes 0,2-0,8 mm long. Corolla glabrous or subglabrous, tube 2-3,2 mm long, lobes up to 0,9 mm long. Stamen-filaments free, up to 7 mm long; anthers 0, 2-0, 25 mm across, with a deciduous apical gland. Ovary glabrous, very shortly stipitate. Pods yellowish- or greyishbrown to brown, $1.8-9.5 \times 1.2-3.4$ cm, oblong, straight or almost so, longitudinally dehiscent, venose, apex rounded to acuminate or distinctly rostrate, sparingly to densely appressed-pubescent or puberulous. Seeds olive-brown to brown, 8-12 mm in diam., +subcircular-lenticular, compressed; central areole 2,5-6 \times 2,5-5 mm, impressed, horseshoe shaped.

49

Widespread in tropical Africa from Senegal in the west to Ethiopia in the north-east, southwards to the Transvaal, Swaziland and Natal. Four varieties are at present recognized within A. senegal, two of which occur in our area.

Inflorescence axis sparingly to densely pubescent throughout; pods up to 3,4 cm wide, usually rostrate or acuminate apically, sparingly to densely pubescent or puberulous, yellowish- or greyish-brown to brown; a shrub branching from or near the base or a tree with a slightly rounded or flattened and somewhat spreading crown; fairly widespread in South West Africa, the Transvaal, Swaziland and Natal......(a) var. rostrata

Inflorescence axis glabrous or sometimes with a few basal hairs; pods up to 1,9 cm wide, rounded to acute apically, sparingly puberulous, yellowish to olive-brown; a slender spindly tree with irregular virgate branches; confined to the northern and eastern Transvaal......(b) var. leiorhachis

(a) var. rostrata Brenan in Kew Bull. 8: 99 (1953); Young in Candollea 15: 96 (1955); Von Breitenbach, Indig. Trees S. Afr. 2: 271 (1965); Schreiber in F.S. W.A. 58: 12 (1967); Ross in Bol. Soc. Found in Angola, South West Africa, Botswana, Rhodesia, Mozambique, the Transvaal, Swaziland and Natal. It is quite probable that this variety has a wider range than indicated here as several specimens from Kenya and the Somali Republic, previously referred to the rather heterogeneous var. kerensis Schweinf., have pods similar to those of var. rostrata. The possibility exists that rostrata is not the earliest epithet available at varietal rank for this taxon (see Bothalia 11: 301,302, 1974). If this proves to be the case then the name of this taxon will have to be altered. The situation in north-eastern tropical Africa needs clarifying. Occurs in woodland, bushveld, thornveld and river valley scrub; often found on alluvium.

Legum.-Mimos.:84 (1959); in F.Z. 3, 1:67 (1970); Palmer & Pitman, Trees S. Afr. 2:751 (1973). Type: Arabia, Surdad and elsewhere, Forskal (C,

holo.).

Much branched, dense, +obconical shrub or a tree to 6 m high. Bark grey-brown to purplish-black, smooth or rough and fissured; young branchlets olive- or reddishbrown to greyish-brown or purplish-black, with numerous somewhat transversely elongated pale lenticels, glabrous or pubescent. Stipules not spinescent, in pairs, linear, $1-2.5 \times 0.2-0.8$ mm, soon deciduous. Prickles in pairs just below each node, strongly recurved, often not spreading but lying almost parallel to each other, up to 6 mm long, grey-brown to blackish. Leaves: petiole 0,2-1,2(2) cm long, glabrous or pubescent, adaxial gland usually present, variable in position, $0,2-0,7 \times 0,2-0,6$ mm; rhachis (0,2)0,5-2(4) cm long, glabrous to pubescent, frequently with a gland at the junction of the top 1-2 pinnae pairs; pinnae 2-3, rarely 4 pairs; rhachillae 0,1-1,6 cm long; leaflets 1-2, rarely 3, pairs per pinna, $3.5-15(20) \times 2-12$ mm, very variable in shape, obliquely obovate to obovate-elliptic or -oblong, apex rounded to emarginate or subacute and often apiculate, venose, glabrous or appressed-pubescent below, margins with or without cilia. Inflorescences subglobose to ellipsoid but the axes clearly elongate, or in elongated spikes, fascicled or solitary. Flowers yellowish-white or cream, buds often with a purplish tinge, on pedicels (0,5)0,75-1,5 mm long; axes 0,15-3,5 cm long; peduncles 0, 3-1, 4 cm long, glabrous or pubescent. Calyx cupular, often tinged with purple apically, glabrous or sometimes slightly pubescent near the apices of the lobes, tube 0,4-1 mm long, lobes very small, up to 0,2 mm long. Corolla glabrous or sometimes slightly pubescent near the apices of the lobes, tube up to 2,5 mm long, lobes to 1,4 mm long, often tinged with purple. Stamen-filaments free, 4-6,5 mm long; anthers 0.15-0.25 mm across, with a deciduous apical gland. Ovary up to 1,1 mm long, glabrous, shortly stipitate. Pods greenishyellow to straw-coloured or brown, 2,5-8

 $(9,3) \times 1,3-2,5(3,2)$ cm, oblong, straight, rounded to acute, acuminate or sometimes rostrate apically, longitudinally dehiscent, chartaceous, venose, glabrous. Seeds 7-10 \times 6-8 mm, subcircular-lenticular, compressed; central areole small, $2-3 \times 2-3$ mm, horseshoe shaped.

Found in Arabia, in north-east Africa from Egypt, the Sudan, Ethiopia southwards to South West Africa, Botswana, the Transvaal, Orange Free State and the Cape Province. Two subspecies are recognized within A. mellifera, both of which occur in our area.

Leaves with normally 2 pinnae pairs; inflorescences \pm elongate, the 0,4-1,8 cm long peduncles usually shorter than the 0,5-3 cm long axes; leaf-rhachides, rhachillae and leaflets glabrous; bark on young branchlets chestnut- or reddish-brown..(a) subsp. mellifera

(a) subsp. mellifera.

Brenan in Kew Bull. 11: 191 (1956); in F.T.E.A. Legum.-Mimos.: 84 (1959); Schreiber in F.S.W.A. 58: 10 (1967).

Mimosa mellifera Vahl, Symb. Bot. 2:103 (1791). Type as above.

Inga mellifera (Vahl) Willd., Sp. Pl. 4: 1006 (1806). Type as above.

Acacia senegal (L.) Willd. subsp. mellifera (Vahl) Roberty in Candollea 11: 153 (1948). Type as above.

Subsp. mellifera is found in Arabia, in north-east Africa from Egypt, the Sudan, Ethiopia southwards to Tanzania, and in Angola and South West Africa. Within our area subsp. mellifera is found only in the Kaokoveld in South West Africa. Occurs in dry localities, often in broken mountainous country.

S.W.A.—1712 (Posto Velho); 11 km S. of the Kunene River at Otjinungua, De Winter & Leistner 5755; on the Kunene at Otjinungua, Hartmann mountains, De Winter & Leistner 5769; Kunene Gorge, Davies, Thompson & Miller 103B.

Subsp. mellifera not infrequently produces larger leaflets than any seen in subsp. detinens; it also tends to be glabrous and the bark tends to be chestnut- or reddish-brown and smooth. In South West Africa subsp. mellifera sometimes has rather slender elongate branchlets which are often unarmed.

Over most of their ranges subsp. *mellifera* and subsp. *detinens* occur exclusively and present no difficulty in their recognition. However, in northern South West Africa and in Angola (and again in north-central Tanzania) they meet and in Tanzania intermediates showing various combinations of

characters occur so that difficulty is sometimes experienced in referring specimens to either subspecies with certainty. Within our area, however, no such difficulty is usually experienced.

(b) subsp. detinens (Burch.) Brenan in Kew Bull. 11: 191 (1956); in F.T.E.A. Legum.-Mimos.: 85 (1959); Palmer & Pitman, Trees S. Afr. 159, t.38, 39 (1961); F. White, For. Fl. N. Rhod. 82, fig. 17D (1962); Von Breitenbach, Indig. Trees S. Afr. 2: 274 (1965); Leistner, Mem. Bot. Surv. S. A. mellifera subsp. detinens, commonly known as "Swart Haak", often forms dense impenetrable thickets.

5. Acacia robynsiana Merxm. & Schreiber in Bull. Jard. Bot. Brux. 27: 268, t.7 (1957); Von Breitenbach, Indig. Trees S. Afr. 2:276 (1965); Schreiber in F.S.W.A. 58: 11 (1967); Palmer & Pitman, Trees S. Afr. 2:758 (1973). Type: South West Africa, Outjo Distr., Grootberg-Hang, Walter 2/197 (M, holo.!).

Shrub with several erect slender branches which tend to droop apically or a slender tree to 8 m high with whip-like branches. Bark yellowish to reddish-brown or purplish; young branchlets whitish or grey- to reddish-brown or purplish, sometimes as though whitewashed over a purplish background, glabrous or subglabrous, with numerous somewhat transversely elongated lenticels. Stipules not spinescent, in pairs, linear, 1,8-3 mm long, 0,2-0,6 mm wide, soon deciduous. Prickles in pairs near each node or often absent, spreading laterally, straightish or slightly recurved, up to 4,5 mm long, reddish-brown to purplish-black. Leaves: petiole (0,1)0,5-1(1,2) cm long, glabrous or subglabrous; rhachis 0-1,2 cm long, glabrous, a gland at the junction of each pinna pair; pinnae 1 or 2 pairs; rhachillae 1,2-3,5(4,4) cm long, glabrous; leaflets 6-13 pairs per pinna, $4-13.5 \times 1.2-3.5$ mm, oblong or obovateoblong, often slightly to strongly falcate, apex rounded, veins usually fairly conspicuous beneath, completely glabrous. Inflorescences spicate, solitary or fascicled. Flowers yellowish-white, sessile or very shortly pedicellate; spikes (0,6)3-5 cm long; peduncles up to 0,5 cm long, glabrous. Calyx glabrous, tube 1,1-3 mm long, lobes up to 1,8 mm long. Corolla glabrous, tube 2,8-4 mm long, lobes up to 2 mm long. Stamen-filaments free or sometimes partially united basally, up to 10,5 mm long; anthers with a deciduous apical gland. Ovary 1,4-1,8 mm long, glabrous, on a stipe up to 2 mm long. Pods pale to dark yellowish-brown, 3,5-6,8 × 1,4-2 cm, oblong, ± straight, longitudinally dehiscent, apex rounded to acute or mucronate, venose, glabrous, sometimes slightly umbonate over the seeds. Seeds olive-brown, 8-10 × 8-10 mm, subcircular, compressed; central areole $1,5-2,5 \times 2-3,5$ mm, horse-shoe shaped.

Confined to South West Africa; found in a fairly restricted area within the Outjo district and in the Kaokoveld. Occurs in rocky ravines, kloofs and on rocky ridges.

S.W.A.—1813 (Ohopoho): 33,2 km from Warmbad on road to Ombombo, De Winter & Leistner 5827. 1914 (Kamanjab): Grootberg, Walter 2/197 (M). 2014 (Welwitschia): 145,6 km W. of Welwitschia on road to Torra Bay, Giess & Van Vuuren 1176; 155 km W. of Welwitschia on road to Torra Bay, De Winter & Hardy 8161; Atsap, Wiss 1476a (M); Twyfelfontein, Wiss 1476b (M).

6. Acacia montis-usti Merxm. & Schreiber in Bull. Jard. Bot. Brux. 27: 270, t.8 (1957); Von Breitenbach, Indig. Trees S. Afr. 2: 278 (1965); Schreiber in F.S.W.A. 58: 10 (1967); Palmer & Pitman, Trees S. Afr. 2: 757 (1973). Type: South West Africa, Brandberg, Welwitsch-Tal, Von Wettstein 95 (M, holo.!).

Tree to 9 m high branching from near the base, "broom-like", crown flattened and spreading or rounded; trunk to 0,5 m in diam. Bark olive- or yellowish- to reddish-brown or purplish-black and smooth when young, grey-brown to black, rough and fissured in mature trees; young branchlets olive-or reddish-brown, with numerous somewhat transversely elongated cream or reddish-brown lenticels, glabrous or subglabrous.

Stipules not spinescent, in pairs, linear, up to 3 mm long, 0,2-0,8 mm wide, soon deciduous. Prickles in pairs near the nodes or frequently absent (rarely a third prickle a short distance below and between the two lateral ones), spreading laterally, straightish or slightly recurved, up to 8 mm long. Leaves: petiole 0,6-2,8 cm long, glabrous or subglabrous, adaxial gland usually present, often just below the lowest pinna pair, slightly raised, $0.3-1.5 \times 0.3-1.5 \text{ mm}$; rhachis 0.8-4(6.8) cm long, glabrous or subglabrous, lower surface usually without recurved prickles, a small gland usually at the junction of the top 1-2 pinnae pairs only, occasionally between each pinna pair or absent altogether; pinnae 2-6 pairs; rhachillae 1,4-4(6) cm long, glabrous or subglabrous; leaflets 4-13 pairs per pinna, $5-14,6 \times 0,9-3(5)$ mm, linear-oblong to obovate-oblong, often slightly falcate, apex obtuse to acute, lateral nerves often fairly conspicuous beneath, margins without cilia, usually glabrous. Inflorescences surfaces spicate, fascicled or solitary. Flowers yellowish-white or pale cream, sessile; spikes 3-8.5 cm long; peduncles 0.2-1.4 cm long, glabrous or subglabrous. Calyx glabrous or subglabrous, tube 1,1-1,8 mm long, lobes 0.2-0.8 mm long, Corolla glabrous or occasionally minutely pubescent near the apices of the lobes, tube 1,4-2,3 mm long, lobes 0,6-1,2 mm long. Stamen-filaments free, up to 8 mm long; anthers with a deciduous apical gland. Ovary up to 1,4 mm long, shortly stipitate, glabrous. Pods oliveor reddish-brown to blackish, $7,6-18 \times$ 1,6-2,4 cm, oblong, \pm straight or slightly curved, apex obtuse to subacute, longitudinally dehiscent, slightly woody but brittle, glabrous or subglabrous, margins conspicuously thickened. Seeds olive- to reddishbrown, $10-13 \times 8-12$ mm, subcircular, compressed; central areole $4-6 \times 3-5$ mm. horse-shoe shaped.

Confined to South West Africa; found in a fairly restricted area within the Omaruru and Outjo districts and in the Kaokoveld. Occurs in rocky ravines, kloofs and on rocky ridges.

S.W.A.—1812 (Sanitatas): ravine near Nawantes, Merxmuller & Giess 1436 (M). 1913 (Sesfontein): 19, 2 km from Warmbad on road to Ombombo, De Winter & Leistner 5841; 30, 4 km from Warmbad on road to Ombombo, De Winter & Leistner 5834. 1914 (Kamanjab): Kaientes, Walter 1/256 (M). 2114 (Uis): Brandberg, Tsisab Valley, below the White Lady, Nordenstam 2528 (M); Brandberg, Tsisab valley, Merxmuller & Giess 1662 (M); Urschler s.n. (M); Wiss 1474 (M).

7. Acacia welwitschii Oliv. in F.T.A. 2:341 (1871): Benth. in Trans. Linn. Soc. Lond. 30:517 (1875); Bak.f., Leg. Trop. Afr. 3:829 (1930); Torre in C.F.A. 2:274 (1956); Brenan in F.Z. 3, 1:78 (1970). Type: Angola, Luanda District, Barra de Bengo, entre Mutolo e Cacuaco, prox. de Quicuxe, Welwitsch 1806 (LISU holo.: BM!, K!, P!).

subsp. delagoensis (Harms) Ross & Brenan in Kew Bull. 21: 67 (1967); Brenan in F.Z. 3, 1: 78 (1970); Van Wyk, Trees Kruger Nat. Park 1: 133 (1972); Palmer & Pitman, Trees S. Afr. 2: 755 (1973). Type: Mozambique, Umbeluzi, Schlechter 11718 (B, holo.†; BM!, K!, Z!).

A. welwitschii Oliv. in F.T.A. 2: 341 (1871) pro parte quoad specim. Kirk; Sim, For. Fl. P.E. Afr. 55, t.37B (1909); Bak.f., Leg. Trop. Afr. 3: 829 (1930) pro parte quoad specim. Rhodesia et Mozambique; Wild, S. Rhod. Bot. Dict. 49 (1953). A. delagoensis Burtt Davy in Kew Bull. 1908: 157 (1908) nom. nud.; Sim, For. Fl. P.E. Afr. 56 (1909) nom. nud.] Harms in Bot. Jahrb. 51: 367 (1914); Burtt Davy, Fl. Transv. 2: 337 (1932); Codd, Trees & Shrubs Kruger Nat. Park 42, fig. 37c, d (1951); Young in Candollea 15: 117 (1955); Von Breitenbach, Indig. Trees S. Afr. 2: 278 (1965); Gomes e Sousa, Dendrol. Moçamb. 1: 234, t.38 (1966). Type as above.

Tree to 13 m high with a rounded, flattened and somewhat spreading or irregularly open crown. Bark yellowish- or greyto reddish-brown or blackish, rough, irregularly fissured; young branchlets grey- to reddish-brown or purplish, glabrous or occasionally sparingly pubescent. Stipules not spinescent, in pairs, \pm linear, 1-3,5 \times 0,3-0,6 mm, glabrous, soon deciduous. Prickles in pairs below the nodes, strongly recurved, often broad-based, greyish-brown to blackish, up to 9 mm long. Leaves: petiole 0,6-1,9(2,4) cm long, adaxial gland usually present, variable in position, 0,3-0,8 × 0,2-0,5 mm; rhachis (0,9)1,2-4,1(5,8) cm long, glabrous or occasionally sparingly pubescent, eglandular or with a gland at the junction of the top pinna pair; pinnae 3-5 pairs; rhachillae 0,7-2,3(3,4) cm long, glabrous or occasionally sparingly pubescent, usually with a small gland at the junction of the top few leaflet pairs or sometimes each leaflet pair; leaflets 3-9 pairs per pinna. $5-9,5 \times 2,5-5$ mm, elliptic or broadly elliptic, sometimes somewhat ovate, apex rounded and often slightly emarginate, nearly

symmetrical basally, glabrous, veins rather prominent beneath. *Inflorescences* spicate, fascicled or solitary. Flowers vellowish-white. sessile or almost so; spikes 2,6-5,6 cm long; peduncles 0,5-1,2 cm long, glabrous or occasionally sparingly pubescent. Calvx sometimes tinged with pink, glabrous, tube 0,9-1,4 mm long, lobes up to 0,9 mm long. Corolla glabrous or occasionally with few glandular hairs, tube 1,6-2,3 mm long, lobes up to 1,1 mm long. Stamen-filaments free, up to 5,5 mm long; anthers \pm 0,15 mm across, with a deciduous apical gland, Ovary to 1,3 mm long, glabrous, stipitate. Pods grey- to reddish-brown, $5,2-12,2(16,6) \times$ 1,4-2 cm, straight, linear-oblong, rounded to ± acuminate apically, longitudinally dehiscent, coriaceous, venose, glabrous. Seeds olive- to reddish-brown, $7-13 \times 7-13.5$ mm, irregularly subcircular, compressed; central areole $4-8 \times 4-9$ mm, horse-shoe shaped.

Found in Malawi, eastern Rhodesia, Mozambique and the eastern Transvaal. Occurs in thornveld and woodland.

TRANSVAAL.—2431 (Acornhoek): Kruger National Park, 12,8 km from Satara on Rabelais road (—BC), Van der Schijff 3293; Kruger National Park, 32 km N.E. of Skukuza near Tshokwane (—DD), Codd & Verdoorn 5480.

Subsp. welwitschii is known only from Angola. The geographical ranges of subsp. welwitschii and subsp. delagoensis are widely separated, and the specimens of each have a markedly different and distinctive "look", yet the only satisfactory morphological difference between the two is in the length of the inflorescence.

A. welwitschii subsp. delagoensis differs from A. burkei in having a glabrous calyx and in being glabrous in most of its parts. It differs from A. nigrescens, which also has a glabrous calyx, in the more numerous pairs of smaller leaflets.

8. Acacia nigrescens Oliv. in F.T.A. 2: 340 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 517 (1875); Sim. For. Fl. P.E. Afr. 54, t.33B (1909); Harms in Engl., Pflanzenw. Type as for A. nigrescens var. pallens. A. mellifera sensu Henkel, Woody Pl. Natal 232 (1934), non (Vahl) Benth. A. nigrescens var. nigrescens—Young in Candollea 15: 119 (1955).

Albizia lugardii N.E. Br. in Kew Bull. 1909: 109 (1909). Type: Botswana, Ngamiland, Okavango valley, Lugard 246 (K, holo.!).

Tree to 30 m high; crown rounded or branches ascending and spreading slightly, often cylindrical in young plants; trunk to 0,75 m in diam., typically beset with persistent prickles arising from swollen knobs up to 6,3 cm long. Bark yellowish-, grey- or reddish-brown, sometimes almost black, rough, fissured; young branchlets yellowish-, grey- or reddish-brown to blackish, flaking minutely, glabrous to pubescent. Stipules not spinescent, in pairs, \pm linear, 1-3 \times 0,2-0,6 mm, soon deciduous. Prickles in pairs below the nodes, strongly recurved, often broad-based, grey- to reddish-brown or black, up to 7 mm long. Leaves: petiole 0,5-4,3 cm long, glabrous to pubescent, adaxial gland often absent, variable in position, $0.3-0.7 \times 0.2-0.5$ mm; rhachis 0,8-10,2 cm long, glabrous to pubescent, usually without a gland at the junction of each pinna pair; pinnae 2-4 pairs; rhachillae

0,3-3,7 cm long; leaflets 1-2(4) pairs per pinna, $(6,5)10-30(50) \times (5,3)7-30(49,8)$ mm, very variable in shape, obliquely obovate-orbicular to broadly obovate-elliptic, apex rounded and often emarginate, subcoriaceous, venose, glabrous above and below or sparingly to densely appressed-pubescent above and/or below. Inflorescences spicate, fascicled, on short lateral branchlets, or occasionally solitary, sometimes crowded into a terminal raceme. Flowers yellowishwhite, sessile; spikes 1-10,2 cm long; peduncles 0,3-2,4 cm long, glabrous or subglabrous, occasionally pubescent. Calyx often tinged with pink or distinctly pinkish-red, glabrous, tube 0,7-1,75 mm long, lobes 0,3-0,8 mm long. Corolla glabrous, tube 1.5-2 mm long, lobes up to 0,75 mm long. Stamen-filaments free, up to 6 mm long; anthers 0,1 mm across, with a deciduous apical gland. Ovary glabrous, 0,6-1,5 mm long, very shortly stipitate. Pods olive- or dark-brown to blackish, $6,1-17,8 \times 1,4$ 2,4(2,7) cm, oblong, straight or nearly so, acuminate apically, longitudinally dehiscent, glabrous, coriaceous, brittle, scarcely venose. Seeds olive to olive-brown, $10-13 \times 10-13$ subcircular-lenticular, compressed: areole $6-8 \times 6-8$ mm, horse-shoe shaped.

Found from Tanzania southwards to South West Africa, Botswana, the Transvaal, Swaziland and Natal (Zululand). Occurs on a variety of soil types in woodland, wooded grassland and bushveld, sometimes near rivers and pans.

A. nigrescens is usually an easily recognized species on account of its 1-2 (rarely 3-4) pairs of large leaflets and glabrous calyces. However, plants are found with leaflets intermediate in size, shape and number between those of A. nigrescens and those of A. burkei Benth. As these plants have pubescent calyces, their relationship appears to be with A. burkei rather than with A. nigrescens and they are discussed in more detail under A. burkei.

A. nigrescens is usually glabrous throughout, but it is occasionally puberulous or even quite densely pubescent. The characteristic raised knobs on the trunk and the larger branches are variable in their occurrence and are, at times, even absent. It is these knobs which have given the species the common names Knob-Thorn or Knoppiesdoring.

A. nigrescens sometimes flowers when quite leafless and may then be difficult to distinguish from A. galpinii which sometimes does the same. A. galpinii may be distinguished by its shorter (0,75-1,25 mm long) usually \pm puberulous calyx and by the corolla-lobes which are usually puberulous outside. In A. nigrescens the calyx is 1,5-2,2 mm long and glabrous, as are the corolla-lobes.

The wood of A. nigrescens is hard, heavy and durable.

9. Acacia burkei Benth, in Hook., Lond. J. Bot. 5: 98 (1846); Harv. in F.C. 2: 282 (1862); Benth. in Trans. Linn. Soc. Lond. 30 : 518 (1875) pro parte excl. specim. A. ferox Benth. in Hook., Lond. J. Bot. 5: 97 (1846) pro parte, nom. illegit., non A. ferox Mart. & Gal. (1843); Harv. in F.C. 2: 282 (1862) pro parte Benth. in Trans. Linn. Soc. Lond. 30: 517 (1875) pro parte; Glover in Ann. Bolus Herb. 1: 151 (1915). Type: Transvaal, Magaliesberg, Burke (K, holo.!).

The holotype of A. ferox is a mixed gathering consisting of a vegetative twig of A. burkei and a fruiting specimen of A. mellifera (Vahl) Benth. subsp. detinens (Burch.) Brenan. A. mossambicensis sensu Henkel, Woody Pl. Natal 233 (1934); Henkel, Ecol. Hluhluwe Game Res. 17, t.vi (1937); non Bolle in Peters, Reise Mossamb. Bot. 1: 5 (1861).

Tree to 27 m high with a rounded. flattened and somewhat spreading or irregularly open crown. Bark pale or dark greyishyellow to brown or almost black, rough, irregularly fissured, flaking, often with persistent prickles scattered over the surface; young branchlets pale or dark greyishyellow or reddish-brown to black, flaking, often minutely, subglabrous to densely pubescent. Stipules not spinescent, in pairs, \pm linear, 1-3,5 \times 0,2-0,6 mm, densely pubescent, soon deciduous. Prickles in pairs below the nodes, strongly recurved, often broad-based, grey to reddish-brown or black, 3-9 mm long. Leaves: petiole (0,4)1-2,3(3,5)cm long, adaxial gland often present, variable in position, 0,3-0,8 mm in diam.; rhachis (0)3,4-7,2(9,1) cm long, subglabrous to densely pubescent, abaxial surface usually without recurved prickles, eglandular or with a gland at the junction of the top pinna pair or top 1-3 pairs; pinnae (1)3-13 pairs; rhachillae 0,6-5,7 cm long, subglabrous to densely pubescent; leaflets (1)4-19 pairs per pinna, $1,2-20,2 \times 0,8-13,1$ mm, very variable in shape, linear to linear-oblong or obovate, obovate-oblong to \pm orbicular, apex acute to rounded. usually markedly asymmetric basally, veins often prominent below, varying from glabrous above and/or below to sparingly or densely pubescent above and/or below, typically pubescent and with a small basal tuft of hairs on the lower surface. Inflorescences spicate, fascicled, often crowded into a terminal raceme, or occasionally solitary. Flowers vellowish-white, sessile or almost so; spikes 1,4-8,5(14,6) cm long; peduncles 0,4-2 cm long, sparingly to densely pubescent, rarely subglabrous. Calyx campanulate, often tinged with pink or distinctly pinkish-red, sparingly to densely pubescent, tube 0,7-1,6 mm long, lobes 0,4-1,1 mm long. Corolla often tinged with pink or pinkish-red, glabrous or apices of lobes sparingly pubescent, tube 1,5-2,1 mm long, lobes up to 1,2 mm long. Stamenfilaments free, up to 6 mm long; anthers ± 0,15 mm across, with a deciduous apical gland. Ovary to 1,6 mm long, glabrous,

shortly stipitate. Pods reddish- or purplish-brown, $4,1-16,9 \times 0,9-2,4$ cm, straight, linear-oblong, \pm acuminate to mucronate apically, longitudinally dehiscent, coriaceous, obscurely venose, glabrous or sparsely puberseent near the margins and stipe. Seeds olivetoreddish-brown, subcircular-lenticular, $6-13 \times 6-11$ mm, compressed; central areole $4-8 \times 3-8$ mm, horse-shoe shaped.

Found in south-eastern Botswana, south-eastern Rhodesia, the Transvaal, Mozambique, Swaziland and Natal (almost confined to Zululand). Occurs on a variety of soil types and on boulder strewn slopes in dry river valley scrub, thornveld, mixed woodland and in scrub.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, 8 km N.E. of Punda Milia, Codd & Dyer 4572. 2426 (Mochudi): 96 km N. of Zeerust, Louw 1503. 2427 (Thabazimbi): 18,7 km from Mabula on Warmbad—Thabazimbi road, Ross 1499 (NH, NU). 2428 (Nylstroom): 7,3 km N. of Warmbad on Nylstroom road, Ross 1494 (NH, NU). 2431 (Acornhoek): Kruger National Park, 1,6 km E. of Skukuza, Codd & Verdoorn 5486. 2527 (Rustenburg): near Hartebeespoort Dam, 4,8 km W. of dam wall, De Winter 5954. 2528 (Pretoria): Pienaarsrivier, Bremekamp sub PRE 29161. 2529 (Witbank): hills on E. side of Loskopdam, Mogg 17307. 2531 (Komatipoort): Kruger National Park, Pretoriuskop, Van der Schijff 3894. 2731 (Louwsburg): Pongola settlement, Codd 10153.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, lower margins of Ndumu Hill, *Tinley 898* (NU). 2731 (Louwsburg): between Candover and Magudu, *Strey 4789*. 2732 (Ubombo): Mkuzi Game Reserve, *Ward 4444*. 2831 (Nkandla): 1,6 km S. of Enseleni River, 11,2 km N. of Empangeni, *Ross 1364* (K, NH, NU). 2832 (Mtubatuba): Hluhluwe Game Reserve, near Hluhluwe River, *Ward 1653*. 2931 (Stanger): 4,8 km S. of Mandini on old main road, Lower Tugela valley, *Ross 1359* (K, NH, NU).

A. burkei is an extremely variable species, particularly in leaflet size, shape and number, and forms part of a taxonomically difficult complex of species. Within our area A. burkei is most closely related to A. nigrescens and to A. welwitschii subsp. delagoensis. However, it differs from both species in having a ± densely pubescent calyx.

In their typical forms A. nigrescens and A. burkei are readily distinguishable: the former with its 1–2 (rarely 3 or 4) pairs of large leaflets and glabrous calyces, and the latter with more numerous pairs of smaller leaflets and pubescent calyces. However, there are numerous plants with leaflets intermediate in size, shape and in number between those of A. nigrescens and those of A. burkei. Leaflet size varies considerably and an entire range from those the size of A. nigrescens may occasionally be found on a single plant. As these plants have pubescent calyces, their relationship seems to be with A. burkei rather than

with A. nigrescens. Although distinct from A. nigrescens in having pubescent calyces and bracts, the superficial resemblance of some of these plants to A. nigrescens is strengthened because they often grow with, or in close proximity to, A. nigrescens.

The range of morphological variation within A. burkei is often not readily apparent to a casual collector, or even from an examination of material in many herbaria. The extremes of the species look very different yet when the range of variation is inspected, it becomes clear that it is not possible to divide this range of variation satisfactorily. It had been customary in the past to distinguish loosely between "big leaflet" and "small leaflet" plants of A. burkei, the former typically having leaflets more than 3 mm wide and the latter leaflets less than 3 mm wide. A detailed study (Ross, 1.c., 1968) revealed that the characters typifying "big leaflet" and "small leaflet" plants varied independently, certain combinations of characters being commoner than others. Each combination, however, is frequently modified by the substitution of individual characters which show correlation, to varying degrees of imperfection, with other characters. Owing to the presence of so many intermediates and the inability to divide this range of variation satisfactorily, no infraspecific categories have been recognized within A. burkei. A numerical study of the species (Ross & Morris in Bothalia 10: 437, 1971) supported this view.

10. Acacia galpinii Burtt Davy in Kew Bull. 1922: 326 (1922); Fl. Transv. 2: 337 (1932); Steedman, Trees etc. S. Rhod. 13 (1933); Stapleton, Common Transvaal Trees 5 (1937); O. B. Miller, Checklist Bech. Prot.: 18 (1948); in J.S. Afr. Bot. 18: 20 (1952); Pardy in Rhod. Agric. Type: Transvaal, banks of Bad-zynloop River, Mosdene Estate, Naboomspruit, 19 Sept. 1920, Galpin 483 M (K, holo.!; BM!, GRA!, PRE!).

A. caffra sensu Oliv. in F.T.A. 2: 345 (1871) tantum quoad specim. McCabe pro parte; Bak.f., Leg. Trop. Afr. 3: 833 (1930) etiam pro parte ut praec. A. dulcis sensu Henkel, Woody Pl. Natal 233 (1934), non Marloth & Engl. A. senegal sensu O. B. Miller, Checklist Bech. Prot. 21 (1948).

Tree to 36 m high; trunk to 2 m diam.; crown often rounded. Bark pale to dark yellowish- or greyish-brown to blackish,

corky when young, rough, often longitudinally fissured, sometimes with scattered persistent prickles arising from swollen bases; young branchlets yellowish- or olive-brown to dark reddish-brown or purplish, glabrous or subglabrous to pubescent. Stipules not spinescent, in pairs, $1-3.5 \times 0.2-0.8$ mm, soon deciduous. Prickles in pairs just below the nodes, recurved or almost straight, often broad-based, dark reddish-brown to black, up to 1,2 cm long, rarely absent. Leaves: petiole (0,6)1,4-3,6(4,8) cm long, adaxial gland usually present, variable in position, round or oval. $0.6-1.5 \times 0.4-1$ mm; rhachis (2.6)5.5-11(14.2) cm long, subglabrous to pubescent, abaxial surface sometimes with recurved prickles, with a gland at the junction of the top 1-6 pinnae pairs, occasionally at the junction of all or nearly all pinnae pairs or absent altogether; pinnae (4)7-14 pairs; rhachillae (2,5)3-6,5(9,2) cm long, glabrous to pubescent; leaflets 12-35(45) pairs per pinna, (3)4-10(12) \times 0,8-3 (3,8) mm, oblong to linear-oblong, the upper sometimes obovate, often slightly falcate, apex rounded to subacute, veins not very prominent beneath, glabrous except for the frequent presence of a small basal tuft of hairs abaxially, rarely sparingly pubescent beneath, margins with or without cilia. Inflorescences spicate, fascicled or solitary, often borne on short lateral shoots. Flowers cream to yellowish-white, sessile; spikes (3,2)5-10 cm long; peduncles 0,3-1,3 cm long, glabrous to sparingly or densely pu-bescent. Calyx cupular, red or purple, 0,75-1,25 mm long, ±puberulous or sometimes subglabrous or glabrous. Corolla red or purplish, subglabrous to puberulous, especially towards the apices of the lobes, tube up to 1,6 mm long, lobes up to 1,4 mm long. Stamen-filaments vellowish-white, 4-6 mm long; anthers 0,15-0,2 mm across, with a deciduous apical gland. Ovary glabrous, 0,8-1,5 mm long, on a stipe up to 0,8 mm long. Pods reddish- to purplish-brown, 11-28 \times 2,3-3,5 cm, straight, apex acute to mucronate, longitudinally dehiscent, valves thinly woody but brittle, venose, slightly umbonate over the seeds, glabrous or almost so. Seeds olive-brown, subcircular-lenticular, $8-12(15) \times 8-12,5$ mm, compressed; central areole $5-8 \times 3,5-7$ mm, horse-shoe shaped.

Found in central Tanzania, Zambia, Malawi, Mozambique, Botswana, Rhodesia and the Transvaal.

Occurs in woodland or bushveld, frequently, but by no means always, on river banks or where moisture is available.

TRANSVAAL.—2328 (Baltimore): Blauwberg, along river near Leipsig, Strey & Schlieben 8575. 2329 (Pietersburg): 49, 6 km W. of Louis Trichardt, south side of Soutpansberg range, Codd 4441. 2427 (Thabazimbi): Thabazimbi, Dyer & Verdoorn 4218. 2428 (Nylstroom): banks of Bad-zyn-loop River, Mosdene estate, Naboomspruit, 19 Sept. 1920, Galpin 483M. 2430 (Pilgrim's Rest): Steelpoort, Smuts & Gillett 3521. 2526 (Zeerust): Leeuwfontein, Reyneke 416. 2528 (Pretoria): Rust de Winter, Codd 5598. 2529 (Witbank): 6,4 km E. of Groblersdal, Codd 2702. A. galpinii, popularly known as the Monkeythorn or Apiesdoring, is one of our largest acacias.

The red or purple calyces and corollas are unusual among the African species of Acacia.

A. galpinii sometimes flowers when leafless and then specimens may be difficult to distinguish from A. nigrescens in the same condition. The differences between the two species are given under A. nigrescens.

Tree to 15 m high; trunk to 0,6 m diam., often with persistent prickles up to 1,5 cm long arising from swollen bases (knobs); crown often somewhat flattened and spreading. Bark pale to dark yellow or yellowishbrown, fissured, flaking or peeling off to reveal a whitish inner layer; young branchlets creamy-white to light grey-brown, puberulous or pubescent, seldom subglabrous. Stipules not spinescent, in pairs, linear, $1,5-3,5 \times 0,2-0,8 \text{ mm}$, soon deciduous. Prickles in pairs just below each node, occasionally absent, strongly recurved, usually broad-based, 3-15 mm long, strawcoloured to brown or blackish. Leaves: petiole 0,5-4 cm long, adaxial gland variable in position, often a short distance below the lowest pinna pair, usually slightly flattened, discoid or oblong, $1.5-4 \times 1.5-3$ mm; rhachis 5,6-20 cm long, puberulous or pubescent, rarely subglabrous, lower surface often with recurved prickles up to 3 mm long, a fairly large gland at the junction of the top 3-16 pinnae pairs; pinnae (6)14-35(45) pairs; rhachillae 1, 2–5, 5(7) cm long, puberulous or pubescent, rarely subglabrous; leaflets 20-60 (68) pairs per pinna, $2-5(6) \times 0,4-0,9(1,25)$ mm, linear to linear-triangular, apex subacute to narrowly obtuse, usually pubescent on the margins only, the midrib and sometimes a few small basal nerves visible below. Inflorescences spicate, solitary or fascicled, usually produced with the new leaves. Flowers yellowish-white or cream, sessile or nearly so; spikes 3-12 cm long; peduncles 0,5-3 cm long, puberulous to densely tomentose, rarely subglabrous, often glandular. Calyx puberulous or pubescent, rarely subglabrous or puberulous on the lobes only, tube 0,7-1,8 mm long, lobes 0,2-0,8 mm long. Corolla subglabrous or puberulous, often only the lobes puberulous, tube up to 2,5 mm long, lobes up to 1 mm long. Stamenfilaments free, up to 6 mm long; anthers ±

0,1 mm across, with a deciduous apical gland. Ovary up to 1,2 mm long, glabrous, shortly stipitate. Pods brown, $6,5-12(15) \times 0,9-1,7(2)$ cm, oblong, straight or almost so, usually acuminate apically, longitudinally dehiscent, coriaceous, venose, glabrous or subglabrous, rarely puberulous. Seeds subcircular to elliptic-lenticular, $7-9 \times 6-8$ mm, compressed; central areole $3-4 \times 2,5-3,5$ mm, horse-shoe shaped, not impressed.

Widespread in tropical Africa from the Gambia and Ethiopia southwards to the Transvaal. Occurs usually on colluvial or alluvial loams or clays by rivers and streams.

TRANSVAAL.—2230 (Messina): 66,4 km from Louis Trichardt on road to Punda Milia, Grobbelaar 699. 2231 (Pafuri): Kruger National Park, M'basa, Lang sub TRV 32219. 2329 (Pietersburg): 1,6 km E. of Louis Trichardt, Codd 3024. 2330 (Tzaneen): Elim (—AA), Obermeyer sub TRV 29295; Letaba River (—CA), Strey 7935.

A. polyacantha subsp. campylacantha may be distinguished from A. caffra in the field by its relatively straight trunk and yellowish-brown flaking bark, its large discoid petiolar glands and the tendency to a flattened spreading crown.

A. polyacantha subsp. polyacantha, with prickles straight or almost so, is known only from India and (probably) Sri Lanka (Ceylon).

Shrub or tree to 14 m high; trunk to 0,6 m diam.; crown often rounded. Bark reddish- or dark-brown to blackish, rough, frequently transversely and longitudinally fissured; young branchlets glabrous to sparingly or densely tomentose, eglandular or with minute reddish glands. Stipules not spinescent, in pairs, linear, $2,5-4 \times 0,2-$ 0,8 mm, soon deciduous. Prickles in pairs just below each node (rarely absent or with a few additional prickles scattered elsewhere on the stems), recurved or sometimes \pm straight, dark-brown to blackish, up to 9 mm long. Leaves: petiole (0,5)0,8-3(4) cm long, adaxial gland variable in position, often slightly below the lowest pinna pair, $0,7-1,\overline{5} \times 0,3-$ 0,7 mm; rhachis (2)5-15(22,7) cm long, glabrous to densely tomentose, abaxial surface often with recurved prickles up to 3 mm long, with a gland at the junction of the top 1-3 pinnae pairs, occasionally between each pinna pair, or absent from some; pinnae (6)8-26(38) pairs; rhachillae (1,1)2,4-5(6,7) cm long, glabrous to tomentose; leaflets (13)21-50(64) pairs per pinna, $2-7(12,2) \times 0,7-1,5(2,3)$ mm, linear to linear-oblong, apex rounded to subacute. glabrous to sparingly or densely appressedpubescent below, margins with or without appressed or spreading cilia. Inflorescences spicate, solitary, fascicled or crowded into an irregular terminal panicle. Flowers yellowishwhite, sessile; spikes (2)2,6-6,5(10) cm long; peduncles (0,2)0,8-2,5(4,1) cm long, subglabrous to densely tomentose, often glandular. Calyx campanulate, puberulous to pubescent or occasionally subglabrous or glabrous, tube 1-1,6 mm long, lobes 0,2-0,8mm long. Corolla sometimes tinged with pink, puberulous to tomentose or occasionally glabrous, tube up to 2,5 mm long, lobes up to 1 mm long. Stamen-filaments free, up to 6 mm long; anthers \pm 0,15 mm across, with a deciduous apical gland. Ovary 0.5-1.9 mm long, glabrous or subglabrous. sessile or shortly stipitate. Pods light or dark brown, $4,5-19,7 \times 0,7-1,5$ (2,7) cm, linear, straight or occasionally ± falcate, rounded to acuminate apically, longitudinally dehiscent, coriaceous, umbonate over the seeds. subglabrous or puberulous, seldom tomentose, with few to numerous reddish-brown glands scattered over the surface. Seeds oliveto light brown, subcircular to ellipticlenticular, 6-12 × 4-8 mm, compressed; central areole $2-5 \times 2-4$ mm, horse-shoe shaped.

Found in south-eastern Botswana, the Transvaal, southern Mozambique, Swaziland, Natal and the Cape Province. Occupies a diverse range of habitats from coastal scrub, dry thornveld and river valley scrub, to mixed bushveld and tall grassland. Frequently occurs amongst boulders or near termite mounds which afford some protection from fire. A dwarf stunted from often occurs on rocky stream banks in the eastern Cape.

A. caffra is widespread throughout much of our area from the western Cape to the northern Transvaal. It is a very variable species, particularly in the degree of development of the indumentum and in the number of pinnae pairs. Of the four varieties recognized within A. caffra, only one, narnely var. tomentosa Glover, remained in common use for some time. Var. tomentosa was distinguished from the other varieties on the number of pinnae pairs, the arrangement of the inflorescences and the degree of pubescence of the young branchlets, peduncles and calyces. In its typical form var. tomentosa is fairly distinctive but the characters typifying it vary independently. The extremes of the species look very different, yet

when the range of variation is inspected, it becomes clear that intermediates are so numerous that infraspecific categories cannot be delimited satisfactorily. The many minutely differing forms in various parts of the species range, whose taxonomic significance seems unworthy of recognition, are therefore regarded as no more than part of the overall range of variation within the species.

However, mention must be made of some specimens from the Potgietersrust, Rustenburg and Waterberg districts of the western Transvaal, for example, Codd 3741, 3996, 4005, 4424, Meeuse 10142, 10144. The variation in leaflet size in these specimens is greater, and leaflets sometimes attain a larger size, than ever recorded in A. caffra in other parts of its distributional range. There is, however, a gradient in leaflet size from A. caffra to the largest leaflets on these specimens. The pods of these specimens differ in being broader than is usual for A. caffra and in frequently having irregularly constricted margins. The plants appear to represent a local variant of A. caffra but it has not been possible to establish whether they represent the response to some edaphic or other environmental condition, or whether they are the result of past introgression with an unknown parent which is now absent from the area. As no suitable means has been found of distinguishing these specimens from A. caffra, they are included in A. caffra.

The differences between A. caffra and A. ataxa-cantha and between A. caffra and A. hereroensis are given under A. ataxa-cantha and A. hereroensis respectively. Specimens of A. caffra in Namaqualand show a definite approach to specimens of A. hereroensis.

The wood of *A. caffra* is heavy and close-grained with a yellowish-white sapwood and a dark brown to blackish heart-wood. Although of no commercial value, it makes good fence poles and is an excellent firewood. The Zulu name of *A. caffra* is "um Thole".

Shrub or tree to 10 m high; trunk to 0,35 m in diam.; branches usually ascending. Bark pale to dark grevish-brown or brown. rough; young branchlets grey- or reddishbrown, densely puberulous to pubescent, frequently with minute reddish glands scattered in amongst the pubescence. Stipules not spinescent, in pairs, linear, 1,8-3,8× 0,2-0,7 mm, soon deciduous. Prickles in pairs just below the nodes, usually strongly recurved, sometimes straightish, often broadbased, up to 8 mm long. Leaves: petiole 0,3-1,3(2,2) cm long, adaxial gland usually present, variable in position, slightly raised or occasionally stalked, $0,4-1,1\times0,1-0,4$ mm; rhachis 1,7-6(10) cm long, puberulous to densely pubescent, abaxial surface often with scattered recurved prickles up to 2 mm long, with a gland at the junction of the top 1-3(7) pinnae pairs and occasionally between the lowest 1-3 pairs; pinnae 8-14(26) pairs; rhachillae (0,5)1-2,4(3,4) cm long, puberulous to densely pubescent; leaflets grey-green, (16)20-36(48) pairs per pinna, $1-4 \times (0,25)0,5-1,1$ mm, linear to linearoblong, apex rounded to subacute, glabrous or sparingly to densely appressed-pubescent below, margins with or without spreading cilia. Inflorescences spicate, solitary, fascicled or crowded into an irregular terminal panicle. Flowers yellowish-white, sessile; spikes (2,2)3-7,4(8,6) cm long; peduncles 0,3-2,8 cm long, puberulous to densely pubescent, often glandular. Calyx densely puberulous to pubescent, tube 1-2 mm long, lobes 0,4-1,1 mm long. Corolla subglabrous or appressed-pubescent especially towards the apices of the lobes, tube up to 3,4 mm long, lobes up to 1.1 mm long. Stamenfilaments free, up to 7,5 mm long; anthers + 0,15 mm across, with a deciduous apical gland. Ovary 0,7-1,5 mm long, glabrous, shortly stipitate. Pods olive- to reddish-brown or brown, $(5)6-11(14) \times (0,9)1,2-2,3$ cm, straight, acute to distinctly acuminate apically, longitudinally dehiscent, margins entire or frequently irregularly constricted between the seeds, umbonate over the seeds,

coriaceous, puberulous to densely pubescent, with numerous minute scattered reddishbrown glands. Seeds olive to light brown, subcircular, $7{\text -}10 \times 5{\text -}10$ mm, compressed; central areole up to 4×3 mm, horse-shoe shaped.

Found in South West Africa, south-eastern Botswana, the western Transvaal, western Orange Free State and the northern Cape Province. Occurs in dry habitats; in grassland, woodland, thornveld, on rocky slopes and flats or, in drier areas, along shallow watercourses. In the Transvaal A. hereoensis is frequently associated with dolomite formations.

A. hereroensis is extremely closely related to A. caffra. It differs from A. caffra in the usually shorter and smaller leaves with more crowded pinnae pairs. These shorter leaves of A. hereroensis often tend to be held erect and do not droop as readily as the longer leaves of A. caffra. A. hereroensis has a more westerly distributional range than A. caffra although in the western Transvaal and south-eastern Botswana their ranges do overlap. However, in parts of the western Transvaal where the two species grow in close proximity, each species may usually be distinguished in the field without difficulty.

In view of the differences in distribution, and the ability of the two taxa to maintain their identity when they grow in proximity, it seems preferable to continue to recognize A. hereroensis and A. caffra as distinct species.

Exped. 243 (1903), non (L.f.) Willd. A. caffra sensu N.E. Br. in Kew Bull. 1909: 107 (1909) pro parte quoad specim. Lugard 93. A. caffra var. tomentosa sensu Bak.f., Leg. Trop. Afr. 3: 833 (1930) pro parte quoad specim. Lugard 93; O. B. Miller, Checklist Bech. Prot. 17 (1948); in J. S. Afr. Bot. 18: 19 (1952) saltem quoad specim. Curson 173. A. catechu subsp. suma (Roxb.) Roberty var. baumii Roberty in Candollea 11: 157 (1948). Type: Angola, Cubango District, bank of the Cubango River, near Kalolo, Baum 438 (G, holo.; BM!, E!, K!, Z!).

Shrub, often with many stems, or a tree to 7 m high; crown rounded or flattened and spreading. Bark pale to dark yellowish- or greyish-brown, rough, the outer layer papery and flaking off; young branchlets pale vellowish or grey to greyish-brown, puberulous to pubescent, with few to many small reddish glands intermixed. Stipules not spinescent, in pairs, linear, $2-4.5 \times 0.2-$ 0,8 mm, soon deciduous. Prickles in pairs below the nodes, usually strongly recurved, broad-based, grey-brown to reddish-brown or purplish, up to 1 cm long. Leaves: petiole 0,3-1(1,3) cm long, adaxial gland variable in position, elliptic or discoid, $0.8-2.2 \times$ 0,4-1,1 mm, reddish-brown to black; rhachis (0,7)1,8-5,6(7,5) cm long, puberulous to densely pubescent, with few small reddish glands intermixed, without a conspicuous gland at the junction of any of the pinnae pairs; pinnae (4)8-16(20) pairs; rhachillae 0,7-2,9 cm long, puberulous to densely pubcscent; leaflets 9-28(35) pairs per pinna, $2-5(6,5) \times 0,5-1,2(1,6)$ mm, linear-oblong, straight or almost so, apex rounded to obtuse or subacute, veins often prominent beneath at first but becoming obscure with age, glabrous or sparingly to densely appressed-pubescent below, margins usually with spreading cilia. *Inflorescences* spicate, solitary or paired, sometimes forming a terminal panicle. Flowers yellowish-white, scssile:

spikes (1,8)2,6-5,4(6,5) cm long; peduncles 0.6-2.4 cm long, puberulous to densely pubescent. Calyx often olive-green, puberulous to densely pubescent, sometimes subglabrous, tube 1,3-2,5 mm long, lobes 0,6-1,2 mm long. Corolla glabrous or slightly puberulous, especially towards the apices of the lobes, tube up to 3,2 mm long, lobes up to 1,4 mm long. Stamen-filaments free, up to 9 mm long; anthers 0, 2–0, 25 mm across, with a deciduous apical gland. Ovary 0.7-1.5 mm long, glabrous or puberulous. stipitate. Pods fawn to dark brown, 4-13,5 \times 1, 1-2(2,3)cm, linear-oblong, straight, rounded to acute or sometimes rostrate apically, longitudinally dehiscent, venose, coriaceous, puberulous to subglabrous, with numerous small reddish glands. Seeds olivebrown, subcircular, $8-12.5 \times 8-12$ mm. compressed; are ole $1-4 \times 1-3$ mm, horseshoe shaped.

Found in Angola, South West Africa, Botswana, Zambia, Rhodesia and the western Transvaal. Occurs in drier types of mixed deciduous woodland, thicket, bushland and scrub, sometimes on sandy flats adjacent to rivers. Frequent on Kalahari sand.

S.W.A.—1719 (Runtu): 12,8 km E. of Runtu, De Winter 3778. 1721 (Mbambi): 31,4 km E. of Nyangana Mission station, De Winter & Marias 4870. 1724 (Katima Mulilo): Katima Mulilo, bank of Zambezi River, Killick & Leistner 3090. 1819 (Karakuwisa): near Karakuwisa, Marsh sub PRE 29609. 1821 (Andara): Andara, Merxmuller & Giess 1357. 1916 (Gobaub): farm Lazy Spade, 48 km N.E. of Outjo, De Winter 3029. 1920 (Tsumkwe): Tsumkwe, 251,2 km E. of Grootfontein, Story 6209. 2017 (Waterberg): Okakarara, Waterberg, Liebenberg 4755. 2219 (Sandfontein): farm Gemsbokfontein, near Botswana border, Merxmuller 1179. TRANSVAAL.—2326 (Mahalapye): Buffelsdrif, Vahrnueijer 1291. 2327 (Ellisras): 4 km N. of Ons Hoop Post Office, beside the Mogol River, Codd 8483. 2526 (Zeerust): 1,6 km S. of Nietverdiend Post Office, Acocks 19184.

A. fleckii is closely related to A. erubescens Welw. ex Oliv. and the two species are often confused. A. fleckii differs from A. erubescens in having:

1. shorter petioles 0,3-1 cm long, occasionally to 1,3 cm; in *A. ernbescens* the petioles are normally 1,3-2,5 cm long. Occasionally petioles shorter or longer than these dimensions occur but then the extremes usually occur on shoots with at least some petioles of more usual length;

 a larger petiolar gland which is elliptic to discoid, 0,8-2,2 mm long; in A. erubescens the gland is often slightly raised and is 0,3-1 mm long. As the dimensions for the two species overlap, gland size is a less useful character; the leaf-rhachis without a gland at the junction of any of the pinnae pairs; in A. erubescens a gland is usually present at the junction of some of the pinnae pairs or between the top pair only;

4. (4)8-20 pinnae pairs; A. erubescens has only 3-7

pinnae pairs:

straight, smaller leaflets; in A. erubescens the leaflets are usually somewhat falcate and larger.

The above characters usually enable the two species to be readily distinguished. Another useful character is the tendency for A. fleckii to produce its inflorescences with or after the new leaves while A. erubescens often flowers when leafless.

15. Acacia erubescens Welw. ex Oliv. in F.T.A. 2:343 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 518 (1875); Harms in Engl., Pflanzenw. Afr. 3,1: 385 (1915); Bak.f., Leg. Trop. Syntypes: South West Africa, Hereroland, Fleck 491 (Z!); Kuiseb Fleck 492a (Z!), Fleck 493a (?Z). A. aff. trispinosa sensu Schinz in Mém. Herb. Boiss. 1:116 (1900). The specimen which Schinz referred to, namely, Luderitz 122 from Hereroland, is in the University of Zurich herbarium. This specimen is without leaves or fruits but is clearly referable to A. erubescens. However, it is as well to point out here that there is more than one Luderitz specimen from Hereroland with the collector's number 122 in the University of Zurich herbarium. Another specimen of Luderitz 122 is A. karroo Hayne. A. sp. sensu Schinz in Mém. Herb. Boiss. 1: 116

(1900). A. kwebensis N.E. Br. in Kew Bull. 1909: 108 (1909). Type: Botswana, Kwebe Hills, Mrs. E. J. Lugard 24 (K, holo.!).

Shrub, often with many stems, or a tree to 10 m high; trunk to 0,3 diam.; crown often flattened and spreading somewhat. Bark pale to dark yellowish- or greyishbrown, rough, the outer layer papery and flaking or peeling off; young branchlets yellowish- or greyish-brown to purplish, puberulous to pubescent, sometimes glabrous, indumentum usually slightly golden. Stipules not spinescent, in pairs, linear, $2-4,2 \times$ 0,2-0,8 mm, soon deciduous. Prickles in pairs below the nodes (very rarely in threes but then all three prickles point downward), usually strongly recurved, broad-based, greybrown to blackish, up to 7 mm long. Leaves: petiole (0,7)1,3-2,5(4) cm long, adaxial gland present or absent, variable in position, often slightly raised, $0.3-0.7(1) \times 0.1-0.5$ mm; rhachis (1)1,5-2,7(5) cm long, usually puberulous to densely pubescent, glands variable, either at the junction of some of the pinnae pairs, between the top pair only or sometimes absent; pinnae 3-7 pairs; rhachillae (1)1,2-3(3,9) cm long, usually puberulous to densely pubescent; leaflets 10-27 pairs per pinna, $3-7,5(10) \times (0,75)1-1,6(2,8)$ mm, obliquely oblong, often slightly falcate or the upper somewhat obovate, apex usually oblique, acute or subacute, sometimes ± rounded, veins often prominent beneath at first but becoming obscure with age, glabrous below or occasionally sparingly pubescent, margins with or without cilia. Inflorescences spicate, fascicled or crowded into an irregular terminal panicle, sometimes solitary. Flowers yellowish-white, sessile; spikes (1,8)2,2-4,5(6) cm long, peduncles (0,6)1,2-2,5 cm long, pubescent. Calyx campanulate, puberulous to densely pubescent, tube 1-2,2 mm long, lobes 0, 6-1, 8 mm long. Corolla tubular, appressed-pubescent, especially towards apices of lobes, tube up to 3 mm long, lobes up to 1,5 mm long. Stamen-filaments free, up to 8 mm long; anthers 0, 2-0, 25 mm across, with a deciduous apical gland. Ovary 0,5-1,9 mm long, glabrous, sessile or shortly stipitate. Pods fawn to dark brown, $3-13 \times 1, 1-1, 8(2,3)$ cm, linear-oblong, straight, rounded to acute or acuminate apically, longitudinally dehiscent, venose, coriaceous, subglabrous except for pubescence on the margins and stipe, glands absent or few and inconspicuous.

Seeds olive-brown, usually subcircular, 7-11 \times 7-11 mm, compressed; areole 1-3 \times 2-4,5 mm, horse-shoe shaped.

Found in Zaire, Tanzania, Zambia, Malawi, Rhodesia, Mozambique, Angola, South West Africa, Botswana and the Transvaal. Occurs in drier types of mixed deciduous woodland or scrub, often on rocky outcrops, in open bush on sand or along the sandy

banks of dry watercourses.

S.W.A.—1713 (Swartbooisdrif): 17,6 km W. of Otjiwero, sandy course of Okahalalana Ndjala River, De Winter & Leistner 5405. 1718 (Kuring-Kuru): 12 km E. of Kuring-Kuru on road to Runtu, De Winter 3950. 1719 (Runtu): 4,8 km S. of Runtu, De Winter 3775. 1821 (Andara): road from Andara to Bagani, Merxmuller & Giess 1994. 1917 (Tsumeb): ± 11 km N. of Tsumeb, Basson 41. 1918 (Grootfontein): Kalkfontein, Liebenberg 4825. 2016 (Otjiwarongo): Omatjenne, Liebenberg 4825. 2115 (Karibib): Usakos, Marloth 1259. 2117 (Otjosondu): Quickborn flats, Bradifield 22. 2216 (Otjimbingwe): farm Otjiseva, near Teufelsbach, Kinges & Wiss 788 (PRE) pro parte. 2217 (Windhoek): near Windhoek, Codd 5797.

In A. erubescens the inflorescences are often produced when the plants are leafless. The flowers are usually sweet-smelling.

The differences between A. erubescens and A. fleckii are given under A. fleckii.

16. Acacia kraussiana Meisn. ex Benth. in Hook., Lond. J. Bot. 1: 515 (1842); Meisn. in Hook., Lond. J. Bot. 2: 103 (1843); Harv. in F.C. 2: 283 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 530 (1875); Wood & Evans, Natal Plants 3,2: t.245 (1901): Glover in Ann. Bolus Herb. 1: 147. t.18/8 (1915); Harms in Engl., Pflanzenw. Afr. 3,1: 390 (1915); Bews, Fl. Natal 114 (1921); Henkel, Woody Pl. Natal 235 (1934); Brenan & Exell in Bol. Soc. Brot. Sér. 2,31:103, t.1 fig. C (1957); Mogg in Macnae & Kalk, Nat. Hist. Inhaca Island 9, 145 (1958); Brenan in F.Z. 3,1:80, t.19C (1970); Ross, Acacia Spp. Natal 33, fig. 2/11 (1971); Fl. Natal 193 (1973). Type: Natal, Umlaas River, Durban [Port Natal], Krauss 198 (K, holo.1; BM1, FI1, OXF1, PRE1, TCD1, Z1).

Scandent shrub or climber to 15 m high.

Bark pale to dark greyish-brown or black; young branchlets grey-brown, usually pube-

rulous and inconspicuously glandular but sometimes pubescent, angular, often hexagonal, some branchlets usually modified into tendrils. Stipules not spinescent, in pairs. + linear, up to 4.5 mm long and 1.1 mm wide, soon deciduous. Prickles irregularly scattered along the internodes, up to 2 mm long, occasionally minute and apparently absent, recurved, arising from longitudinal bands along the stem which are usually concolorous with the intervening lenticellate bands. Leaves: petiole 0,8-2,7 cm long, subglabrous to densely puberulous, adaxial gland usually immediately above the pulvinus, raised, up to 2,8 mm long; rhachis 2-6,2 cm long, subglabrous to densely puberulous or pubescent, lower surface usually scattered recurved prickles up to 3 mm long, a small gland usually at the junction of the top pinna pair only; pinnae (1)3-6 pairs; rhachillae 0,9-5(6,9) cm long, subglabrous to densely puberulous; leaflets 6-17 pairs per pinna, $5-15(23) \times (2)3-6(8)$ mm, linearoblong to obovate-oblong, often slightly falcate, the lowest pair very much reduced and bract-like, apex acute or shortly mucronate, midrib excentric basally, lateral veins conspicuous beneath, glabrous or nearly so, rarely puberulous or pubescent, marginal cilia usually absent. Inflorescences capitate, forming a terminal panicle. Flowers yellowish-white, very shortly pedicellate; peduncles 0,7-2,8 cm long, densely puberulous or pubescent. Calyx glabrous to sparingly or densely puberulous, tube 1,6-2,2 mm long, lobes 0,6-1,1 mm long. Corolla glabrous, tube 2,6-4,2 mm long, lobes 0.5-1.5 mm long. Stamen-filaments free, up to 8,5 mm long; anthers with a deciduous apical gland. Ovary pilose, up to 2 mm long, on a stipe longer than itself. Pods pale or dark brown, $5,9-16,2 \times (0,9)1,4-2,5$ cm, linear-oblong, subcoriaceous, markedly umbonate over the seeds, sometimes irregularly constricted between some of the seeds, venose, tardily longitudinally dehiscent or at times indehiscent, apex rounded to mucronate, margins not strongly thickened, mostly glabrous or subglabrous and with minute reddish glands, especially when young. Seeds olive or dark-brown to blackish, $5.5-9 \times 4-6$ mm, ellipsoid, somewhat compressed; areole $4-7 \times 2,5-4$ mm.

Found in Natal and Mozambique. Essentially a coastal species and usually found below 110 m, often growing near the shore. Occurs on forest margins, in forest clearings, in scrub, bushland and, in Tongaland, in dry sand forest. Often forms fairly dense impenetrable thickets.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, Matini forest, Tinley 944 (NH, NU). 2731 (Louwsburg): between Vryheid and Nongoma, Pole Evans 3581, 2732 (Ubombo): False Bay Park, Ross 2328, 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 3965, 2930 (Pietermaritzburg): Isipingo, Acocks 10873, 2931 (Stanger): Hawaan forest, S. bank of Umhlanga River, Ross & Moll 2261, 3030 (Port Shepstone): Doonside, Galpin 9534.

A. kraussiana is a very distinct species which is readily distinguished by its few pinnae pairs and large leaflets from both of the other Acacia species with scattered recurved prickles and capitate inflorescences occurring in our area. However, A. kraussiana is sometimes confused with Entada spicata (E. Mey.) Druce. E. spicata differs in having a spicate inflorescence and pods in which the valves at maturity (but not the margins) split transversely into one-seeded segments, the segments falling away from the margins which persist as a continuous but empty frame. Unlike A. kraussiana in which the lowest pair of leaflets on each pinna are bract-like, the lowest pair of leaflets in E. spicata are well developed.

A specimen of A. kraussiana, Mrs. Hutton 106 (BM, GRA), carries the locality "Shafton, Howick, Natal". As A. kraussiana is not known to occur more than a few kilometres inland from the coast south of the Tugela River, it seems unlikely that this specimenwas collected near Howick. Perhaps the label does not belong with the specimen.

17. Acacia brevispica Harms in Notizbl. Bot. Gart. Berl. 8: 370 (1923); Bak.f., Leg. Trop. Afr. 3: 853 (1930); Brenan, Checklist Tang. Natal 234 (1934) pro parte, non (L.) Willd. sensu stricto. A. brevispica sensu Brenan &

Exell in Bol. Soc. Brot., Sér. 2, 31:114 (1957) quoad pl. Mozamb., Natal, Cape. A. brevispica var. dregeana (Benth.) Ross & Gordon-Gray in Brittonia 18:63 (1966). Type as above.

Scandent shrub up to 12 m high, a nonclimbing shrub or sometimes a small tree to 3 m high: young branchlets grey-brown, very shortly puberulous or rarely glabrous, with numerous minute reddish glands. Stipules not spinescent, in pairs, ± linear, up to 4,5 mm long, 0,3-1,2 mm wide, soon deciduous. Prickles scattered along the internodes, recurved or spreading, arising from longitudinal bands which are usually paler than the intervening lenticellate bands, 0,5-4 mm long. Leaves: petiole 0,5-3,5 cm long, adaxial gland often present, variable in position; rhachis 3,2-10 cm long, shortly puberulous to subglabrous, with or without recurved prickles abaxially, a gland often present at the junction of the top 1-3 pinnae pairs; pinnae 5-20 pairs; rhachillae 1,4-3,8 cm long; leaflets 24-62 pairs per pinna, 2,5- $5 \times 0.5-1(1.2)$ mm, linear-oblong, lower surface usually appressed-pubescent throughout, at times on portion of surface only or occasionally leaflet entirely glabrous, margins usually with short inconspicuous cilia, sometimes absent. Inflorescences capitate, on axillary peduncles, racemosely arranged or aggregated into an irregular terminal panicle. Flowers yellowish-white, sessile or very shortly pedicellate; peduncles 1-2,5 cm long, puberulous, with numerous minute reddish glands. Calyx campanulate, puberulous to almost glabrous, tube 0,7-1,8 mm long, lobes 0.3-0.8 mm long. Corolla campanulate, tube up to 2,5 mm long, lobes up to 1 mm long. Stamen-filaments free, up to 4 mm long; anthers with a deciduous apical gland. Ovary densely pubescent, up to 1,2 mm long, on a stipe longer than itself. Pods brown, $5,7-15(21) \times (1,1)1,8-2,8$ cm, oblong to linear-oblong, straight or almost so, rarely slightly falcate, longitudinally dehiscent, subcoriaceous to coriaceous, umbonate over the seeds, usually densely puberulous and with numerous minute reddish glands. Seeds olive-brown, $8-12 \times 6-10$ mm, elliptic, compressed: areole $6-8 \times 3-5$ mm.

Occurs in southern Mozambique, the eastern Transvaal, Swaziland, Natal and the eastern Cape (Pondoland). Found in dry thornveld and in dry river valley scrub; often forms dense impenetrable thickets.

TRANSVAAL.—2431 (Acornhoek): Kruger National Park, Munweni River, Brynard & Pienaar 4327.

SWAZILAND.—2631 (Mbabane): Stegi Hill, Compton 28418. 2731 (Louwsburg): Ingwavuma Poort, Compton 28629.

Typical A. brevispica is widespread in tropical Africa, but occurs nowhere closer to our area than Angola and central Tanzania. In tropical Africa typical A. brevispica is relatively uniform and no difficulty is experienced in distinguishing it from A. schweinfurthii. A. brevispica subsp. dregeana, however, is characteristically very variable and in our area it bridges many of the discontinuities which exist between typical A. brevispica and A. schweinfurthii in the tropics. Consequently difficulty is sometimes experienced in distinguishing specimens of A. brevispica subsp. dregeana from A. schweinfurthii.

A. schweinfurthii var. schweinfurthii differs from A. brevispica subsp. dregeana in having:

- 1. typically longer petioles (1,5)2,6-5,5 cm long;
- a distinctly humped petiolar gland situated immediately above the pulvinus, sometimes two glands are present or, on occasions, the gland is absent;
- 3. leaflets usually larger, $2,5-8 \times 0,8-2$ mm;
- leaflets glabrous on the lower surface apart from appressed marginal cilia. In A. brevispica subsp. dregeana when the lower leaflet surface is entirely glabrous the marginal cilia are usually lacking too so that the leaflets are completely devoid of hairs:
- pods glabrous or almost so except for the glands; lacking the dense puberulence of A. brevispica subsp. dregeana.

There is an overlap in petiole length and in leaflet width between A. brevispica subsp. dregeana and A. schweinfurthii var. schweinfurthii, but in combination the above characters usually enable A. schweinfurthii var. schweinfurthii to be distinguished from subsp. dregeana. Certainly, most specimens can be readily sorted. Some specimens do, however, undoubtedly create difficulties and it is sometimes debatable whether they are robust specimens of A. brevispica subsp. dregeana or depauperate specimens of A. schweinfurthii. Ross 874 (NU) from 3 km S. of Mandini in the Lower Tugela valley is difficult to place as it has long petioles and the general facies of A. schweinfurthii, but the petiolar

glands are not humped, the leaflets are appressed pubescent beneath and the pods are ±densely puberulous. The specimen seems best regarded as a robust specimen of A. brevispica subsp. dregeana.

Ross 764 (NU) from the Weenen district of Natal is unusual in that some of the pinnae are themselves

bipinnate.

True A. pennata (L.) Willd. does not occur in Africa, but until fairly recently the name was used in a wide sense to cover A. brevispica, A. schweinfurthii and several other species which occur in tropical and subtropical Africa.

18. Acacia schweinfurthii Brenan & Exell in Bol. Soc. Brot., Sér. 2, 31: 128, t.1 fig. E (1957); Brenan in F.T.E.A. Legum.-Mimos.: 99, fig. 15/27 (1959); White, For. Fl. N. Rhod. 84 (1962); Von Breitenbach, Indig. Trees S. Afr. 2: 286 (1965); Brenan in Kew Bull. 21: 477 (1968); in F.Z. 3,1: 83, t.19 fig. E (1970); Palmer & Pitman, Trees S. Afr. 2: 813 (1973). Type: the Sudan, Gubbiki, Schweinfurth 2206 (BM, holo.!; K!, P!, Z!).

A. brevispica Harms var. schweinfurthii (Brenan & Exell) Ross & Gordon-Gray in Brittonia 18: 62 (1966). Type as above.

var. schweinfurthii.

Brenan & Exell l.c.: 130 (1957); Brenan in F.T.E.A. Legum-Mimos.: 99 (1959); in F.Z. 3,1:83 (1970); Ross, Acacia Spp. Natal 38, fig.2/9 (1971); in Bothalia 10:419 (1971); Fl. Natal 193 (1973).

A. pennata sensu Harv. in F.C. 2:283 (1862) pro parte quoad specim. Gueinzius; Wood & Evans, Natal Plants 3, 2:t.244 (1901); Bews, Fl. Natal 114 (1921) pro parte; Glover in Ann. Bolus Herb. 1:147 (1915) pro parte quoad ref. Wood & Evans Natal Plants t.244; Henkel, Woody Pl. Natal 234 (1934) pro parte; Hutch., Botanist in S. Afr. 308, 390, 468, 664 (1946); Codd, Trees & Shrubs Kruger Nat. Park 48 (1951), non (L.) Willd. sensu stricto.

Scandent shrub up to 12 m high or a non-climbing shrub to 3 m high; young branchlets olive-green to olive-brown or grey-brown, puberulous when young but often becoming glabrous, with numerous reddish glands. Stipules spinescent, in pairs, \pm linear, up to 5 mm long, up to 1,2 mm wide, soon deciduous. Prickles irregularly scattered along the internodes, recurved or spreading, arising from longitudinal bands which are often darker than the intervening lenticellate bands, 1-4,5 mm long. *Leaves*: petiole (1,5)2,6-5,5 cm long, with a humped gland $1-2 \times$ 0,5-1 mm usually situated immediately above the pulvinus, sometimes two glands present or gland absent; rhachis (3)6-16 cm long, sparingly to densely puberulous, with

or without recurved prickles abaxially, a gland often present at the junction of the top 1-2 pinnae pairs; pinnae (5)9-17 pairs; rhachillae (1,8)3-7,6 cm long, sparingly to densely puberulous; leaflets 17-60 pairs per pinna, 2,5-8 × (0,8)1-2 mm, linear or linear-oblong, midrib nearer one margin basally, margins with whitish \pm conspicuous appressed cilia, invariably glabrous beneath except for the marginal cilia. Inflorescences capitate, on axillary peduncles, usually arranged in ± pyramidal panicles. Flowers yellowish-white, sessile or very shortly pedicellate; peduncles 0,5-2,4 cm long, sparingly to densely puberulous, numerous, minute reddish glands. Calvx puberulous or rarely subglabrous, tube 1-1,8 mm long, lobes up to 0,8 mm long. Corolla subglabrous to puberulous, especially towards the apices of the lobes, tube up to 2,2 mm long, lobes up to 0,8 mm long. Stamen-filaments free, up to 5 mm long; anthers with a deciduous apical gland. Ovary densely pubescent, up to 1,5 mm long, on a stipe longer than itself. Pods olive-brown to brown, $8-18 \times 1,4-2,5$ cm, oblong, straight or almost so, tardily longitudinally dehiscent or at times indehiscent, coriaceous or subcoriaceous, ± transversely plicate and umbonate over the seeds, glabrous or almost so, usually with numerous minute reddish glands, especially towards the margins and stipe. Seeds dark reddish-brown, 8-12 × 6-8 mm, elliptic, compressed; areole 6-8 x

Found from the Sudan southwards to the Transvaal and Natal. Occurs most frequently in riverine fringing vegetation where it usually forms dense impenetrable thickets; also occurs in woodland, scrub and on forest margins away from rivers.

TRANSVAAL.—2229 (Waterpoort): Wyllie's Poort, Hutchinson 2095. 2230 (Messina): Nwanedzi, [Vanetzi] River, Gerstner 6083. 2328 (Baltimore): Wagon Drift, Mogalakwena [Magalakwin] River, Hutchinson 2674. 2330 (Tzaneen): 80 km N. or Gravelotte station, on bank of Great Letaba River, Galpin 13532—the precise locality of this specimen is uncertain because the Great Letaba River is only 32 km N. of Gravelotte by road; the Small Letaba River, however, is ± 80 km N. of Gravelotte. 2331 (Phalaborwa): Kruger National Park, Letaba, Lang s.n. 2430 (Pilgrim's Rest): Blyde River Poort, Van der Schijff 5933. 2431 (Acomhoek): Kruger National Park, near Skukuza Camp, Codd & De Winter 5113. 2531 (Komatipoort): Crocodile River Poort, Rogers 22233.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, near Banzi Pan, Ross 697 (K, NH, NU). 2732 (Ubombo): Mkuzi bridge, 3 km N. of Mkuze on Candover road, Ross 1022 (K, NH, NU). 2831 (Nkandla): Umfolozi Game Reserve, Matshamshlope, Downing 561 (NH, NU). 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 1835. 2930 (Pietermaritzburg): Durban district, Clairmont, Wood 8022 (E, GRA). 2931 (Stanger): 40 km from Kranskop on Mapumulo valley road, Moll 921. Grid ref. uncertain: Durban [Port Natal], Gueinzius s.n. (K, TCD).

Difficulty is sometimes experienced in distinguishing specimens of A. schweinfurthii var. schweinfurthii from specimens of A. brevispica subsp. dregeana. The main differences between these two species are discussed under A. brevispica subsp. dregeana.

So far only var. schweinfurthii has been recorded from our area. Variety sericea Brenan & Exell differs from var. schweinfurthii in having the leaflets \pm appressed silky-pubescent beneath. Var. sericea is known from relatively few gatherings in Tanzania, Zambia, Rhodesia and Mozambique.

The specimen, Ross 874, discussed under A. brevispica subsp. dregeana differs from var. sericea in having±densely puberulous pods.

True A. pennata (L.) Willd. does not occur in Africa, but until fairly recently the name was used in a wide sense to cover A. schweinfurthii, A. brevispica and several other species which occur in tropical and subtropical Africa. Often A. schweinfurthii is likely to be the species referred to, but there is usually no certainty.

* non Sim in Agric. J. 19 (1900); For. Fl. Cape Col. 211, t.59 (1907). Sim was apparently referring to A. sieberana DC. var. woodii (Burtt Davy) Keay & Brenan as evidenced by his description of the bark as "yellowish white flaky" and of the pod as "4 inches long, \(\frac{1}{2}\)1 inch wide, solid, indehiscent, tomentose". However, A. sieberana var. woodii seldom has only 4 pinnae pairs as described by Sim and the involucel is in the upper half of the peduncle or apical and not in the lower third as illustrated by Sim in t.59. Sim described the inflorescence as "light yellow or nearly white" which is in contrast to the bright yellow Inflorescence of A. karroo. A. robusta Burch., however, which often has only 4 pinnae pairs, has a whitish inflorescence and has the involucel in the lower third of the peduncle so it appears as though Sim's description of A. hirtella may possibly have been taken from A. sieberana var. woodii and from A. robusta. Sim, For. Fl. P.E. Afr. 57, t.35A (1909), was clearly referring to A. robusta.

(1875); Burtt Davy in Kew Bull. 1908: 159 (1908;) Sim, For. Fl. P.E. Afr. 57 (1909); Glover in Ann. Bolus Herb. 1: 150, t.19/18 (1915); Bews, Fl. Shrub, often several stemmed, or a tree to 22 m high, sometimes very slender, spindlelike, and sparsely branched; crown rounded, often irregularly so, or flattened; trunk to 0,75 m diam. Bark dark brown, reddishbrown, brownish-black to black, rough, often fissured, or white to pale greyish-white or grevish-brown and smooth, the latter often with scattered persistent paired spines; young branchlets reddish- to purplish- or blackishbrown, often flaking to expose a rusty-red inner layer, sometimes white to yellowish- or greyish-brown and smooth, glabrous or sometimes sparingly to densely pubescent, eglandular or with small inconspicuous reddish sessile glands. Stipules spinescent, in pairs, usually 0,4-7(10) cm long, sometimes greatly elongated to 25 cm long, the latter usually slightly inflated and up to ± 1 cm in diam., remaining distinct to the base and not confluent, straight or sometimes ± deflexed, whitish or the same colour as the stem, entire plant frequently exceedingly spinescent; other prickles absent. Leaves; petiole 0,5-1,8 cm long, adaxial gland usually present, variable in position, usually rounded or oval, up to 1.5×1.5 mm; rhachis (0)1-4,6(9) cm long, glabrous or sometimes sparingly to densely pubescent. with a vellowish- or reddish-brown to black gland at the junction of each of the top 1-3 pinna pairs, between every pinna pair or absent from some; pinnae (1)2-6(13) pairs; rhachillae (1)1,5-3,8(7,2) cm long, glabrous or sometimes densely pubescent; leaflets 5-15(27) pairs per pinna, $(2,8)3,5-8(12,5) \times$ 1-2,5(5) mm, linear, linear-oblong to obovate-oblong, eglandular, apex rounded to subacute but not spinulose-mucronate, usually glabrous but sometimes fairly densely pubescent beneath, margins usually without cilia but sometimes spreading cilia present. Inflorescences capitate, on axillary peduncles, fascicled or sometimes solitary, forming terminal racemes, sometimes on lateral axillary branchlets, the entire inflorescence irregular terminal panicle. forming an Flowers bright yellow, sessile; peduncles 0,7-2,4(4) cm long, glabrous or occasionally densely pubescent, sometimes glandular; involucel \(\frac{1}{2}\) way up the peduncle (when the flowers are young the involuced often appears apical, but as the peduncle lengthens the involucel soon assumes its true position), ± 2 mm long. Calyx glabrous throughout or apices of lobes sparingly or sometimes ± densely pubescent, tube 1,2-1,8 mm long, lobes up to 0,5 mm long. Corolla glabrous or almost so, tube 1,5-2,3 mm long, lobes up to 0,8 mm long, reflexed. Stamen-filaments free, up to 5 mm long; anthers with a deciduous apical gland. Ovary glabrous, up to 1,5 mm long. Pods yellowish- or reddishbrown to brown, $(4)5-10,5(21) \times 0,5-$ 0,7(1,1) cm, linear, slightly to strongly falcate or sometimes straightish, usually constricted between the seeds, often distinctly moniliform, apex rounded to acuminate, sometimes attenuate at both ends, longitudinally dehiscent, usually longitudinally venose, mostly glabrous but at times densely tomentellous, sometimes inconspicuously glandular. Seeds olive-brown or brown, $(3,5)4,5-6,5(9) \times (2)3-4(7)$ mm, elliptic or lenticular, sometimes ± quadrate, compressed; are ole 3-5, $5(7) \times 2-3$, 5(4,5) mm.

Found in southern Angola, Botswana, Zambia, Rhodesia, Malawi, Mozambique and throughout our area. A. karroo is the most widespread Acacia in southern Africa and it occupies a diverse range of habitats including dry thornveld, river valley scrub, bushveld, woodland, grassland, the banks of dry watercourses, riverbanks, coastal dunes and coastal scrub.

A. karroo, the Sweet Thorn or Soetdoring, is apparently one of the least exacting Acacia species in regard to habitat preference and has therefore been able to inhabit a diverse range of habitats. Consequently, A. karroo is an exceedingly variable species. There is strong evidence that the variation within A. karroo is regional; plants in various parts of the species geographical range often having a different "look". This variation is considered in more detail in Bothalia 10(2): 385–402 and in Bothalia 10(3): 427–

430 (1971).

"Typical" A. karroo grows in the Karoo and in the drier parts of the Cape Province as a shrub or relatively small tree with dark rough bark, usually (1)2–3(5) pinnae pairs per leaf, and 6–12 pairs of leaflets per pinna which are 4–8 \times 1,5–2,5 mm. A narrow fringe of larger trees often occurs along the banks of rivers and these frequently enable the course of a river to be detected from afar.

Apart from the "typical" form of A. karroo, a number of other entities are recognizable within the species. Some of the more important are enumerated below:

 The white-barked trees or shrubs with short spines, 4-7(13) pinnae pairs per leaf and 12-18(27) pairs of smaller, narrower leaflets per pinna (A. natalitia) which are found chiefly in the eastern Cape, Natal, Swaziland and the eastern Transvaal. A. hirtella from the Natal coast is similar but differs in having pubescent young branchlets, leaves, leaflets and peduncles.

 The small slender shrubs up to 1 m high found in the eastern Cape in the vicinity of the Kei River mouth. A very local entity of which *Dyer* 4502 is a typical specimen.

3. The "fire-resistant" shrubs found in the Nongoma district of Zululand (A. inconflagrabilis).

4. The slender, sparingly branched trees up to 6 m high found in Zululand, particularly in the Hluhluwe and Umfolozi Game Reserves and in the corridor linking the two reserves (popularly termed "spindle A. karroo"). A "spindle" growth form also occurs near the Loskop Dam in the Transvaal. The plants typically have bright reddish-brown minutely flaking bark, glaucous foliage, large flattened ± discoid petiolar glands and a large gland at the junction of each or almost every pinna pair. Ward 2123 and Codd 9616 will serve to establish the identity of this entity.

5. The large trees with greyish-white bark, long spines up to 25 cm long and long moniliform pods found along the Zululand coast from about the mouth of the Tugela River and northwards to Mozambique. Plants are confined to a fairly narrow belt along the coast which is sometimes only a few kilometres wide. Plants grow on the coastal plain, among the coast dunes, in the mouths of many river estuaries, for example, the Amatikulu and around the shore of the fresh water Lake Sibayi. The plants, which usually form very dense pure stands and are often dominant to the exclusion of other trees, often act as pioneers in stabilising loose sand dunes, especially in disturbed areas and in patches of regenerating coast dune forest. Unlike in "typical" A. karroo, the paired spines often persist on the trunk in these plants. Gerstner 4526 and Strey 4960 will serve to establish the identity of these plants.

6. On the Transvaal highveld from Pretoria eastwards there appears to be a local tendency for the production of a sparse indumentum on the young branchlets, leaves, peduncles and pods (A. karroo var. transvaalensis). However, occasionally this tendency is so extreme, for example, at Steelpoort, as to alter the general appearance of the plants completely. Indeed, the latter, for example Codd 6702 and Ross 2089, 2094, bear a strong superficial resemblance to A. gerrardii. The differences between these plants and A. gerrardii are given under the latter. These pubescent Transvaal specimens also differ in many respects from the pubescent specimens of A. karroo found on the Natal south coast.

7. On the Springbok Flats north of Pretoria small shrubby plants occur which often can be distinguished from A. tenuispina only with difficulty. Some of the plants have a similar growth form to A. tenuispina but as they lack spinulose-mucronate leaflet apices and glandular pods they are referred to A. karroo. It has been suggested by some collectors that the plants may be hybrids between A. karroo and A. tenuispina. Burtt Davy 4075 and Codd 7040 are examples of this entity.

Within the species numerous biotypes are recognizable, each of which varies independently but usually within certain limits, the limits of each falling within the range of variation that is accepted as A. karroo. The extremes of each of the variants are usually quite distinctive and naturally it is these extremes that attract immediate attention. However, it is found that the extremes of each variant are linked to the "central A, karroo gene-pool" by numerous and varied intermediate stages that become progressively less and less distinct until a stage is reached where it is difficult to assign a specimen to a particular entity with any degree of certainty. It therefore becomes difficult to delimit each entity clearly. Consequently, it seems preferable to regard A. karroo as an inherently variable species in which no formal infraspecific categories are recognized rather than to fragment the species into a number of somewhat arbitrary infraspecific taxa.

A. karroo has the ability to encroach rapidly into grassland grazing areas, particularly in over-grazed areas, and is consequently considered a serious menace in parts of its range. Attempts to eradicate plants by chopping often result in a vigorous coppice growth.

A good quality gum is exuded from the stems and was at one time exported as "Cape Gum".

A tendency of A. karroo, shared also by A. nilotica (L.) Willd. ex Del. and sometimes also by A. davyi N.E. Br., is for a few flowers to develop in the involucel on the peduncle, sometimes giving the appearance of a smaller secondary capitulum below the main one. The flowers in this secondary capitulum in A. karroo often develop before those in the main capitulum. Most of these flowers appear to be sterile, but this needs further investigation.

Of all the indigenous Acacia species, A. karroo appears to be subjected to the severest attacks by the wattle bagworm, Kotochalia junodii (Heyl.). The degree of infestation is often sufficient to kill fairly large trees.

20. Acacia tenuispina Verdoorn in Bothalia 6: 156, fig. 5 (1951); Brenan in F.Z. 3,1: 90 (1970); Ross in Bothalia 10: 351 (1971). Type: Transvaal, Hoogbult Farm, Naboomspruit, Galpin 475 M (PRE, holo.!; K!).

A. permixta var. glabra Burtt Davy in Kew Bull. 1922: 330 (1922); Fl. Transv. 2: 340 (1932); Hutch., Botanist in S. Afr. 664 (1946). Type as above.

Stoloniferous slender shrub 0,3-1(2) m high, many stemmed and often forming dense thickets; young branchlets grey- or reddishbrown to purplish-black, with numerous small scattered glands, often glutinous, glabrous or subglabrous. Stipules spinescent, in pairs, 0,4-5,6 cm long, straight or slightly deflexed, slender, whitish, glabrous; other prickles absent. Leaves: petiole 0,2-1,1 cm long, glabrous or subglabrous, adaxial gland absent; rhachis 0-3,8 cm long, glabrous or subglabrous, with a sessile to shortly stipitate

gland at the junction of the top 1-2 pinnae pairs or of the only pair of pinna, otherwise with small scattered glands; pinnae 1-6 pairs; rhachillae 0,3-1,8 cm long, glabrous or subglabrous, usually with small scattered glands; leaflets (3)4–9 pairs per pinna, $(2,1)3-4.8 \times$ 0,8-1,5 mm, linear or linear-oblong to obovate-oblong, glabrous, entire, eglandular, lateral nerves invisible beneath. spinulose-mucronate. Inflorescences capitate, on axillary peduncles, solitary or fascicled, scattered along shoots of the current or previous season. Flowers bright yellow, sessile or very shortly pedicellate; peduncles 0,8-3 cm long, glabrous or subglabrous, sparingly to densely glandular; involucel at or above the middle of the peduncle, 1-2 mm long. Calyx glabrous, tube 1,4-1,8 mm long, lobes up to 0,5 mm long. Corolla glabrous, tube 1,9-2,8 mm long, lobes up to 1 mm long, often reflexed. Stamenfilaments free, up to 5 mm long; anthers with a deciduous apical gland. Ovary shortly stipitate, glabrous, up to 2 mm long. Pods pale to dark yellowish- or chestnut-brown, $1,9-4(7,4) \times 0,4-0,8$ cm, slightly to strongly falcate, longitudinally dehiscent, venose, not or only slightly constricted between the seeds, with numerous dark sessile pustular glands scattered over the surface, slightly glutinous. Seeds olive to olive-brown, $4-7 \times 3,5-5$ mm, elliptic, compressed; areole $2-4 \times 1,5-3$ mm.

Found in south-eastern Botswana and the western Transvaal. Forms extensive low thickets, usually on black cotton soil.

TRANSVAAL.—2328 (Baltimore): near Villa Nora, Acocks 8819. 2426 (Mochudi): 12,8 km S.W. of Rooibokkraal, Codd 8655. 2427 (Thabazimbi): Rooiberg, Mogg s.n. 2428 (Nylstroom): Mosdene, Naboomspruit, farm Doornshoek, Galpin M541. 257 (Rustenburg): 8 km N.E. of P.O. Bospoort on road to Beestekraal, Codd 6370. 2528 (Pretoria): 16 km N. of Pieniaars River station, 3,2 km E. of turning to Mackenzie, Codd 850.

On the Springbok Flats north of Pretoria small shrubby plants occur which often can be distinguished from A. tenuispina only with some difficulty. Some of the plants have a similar growth form to A. tenuispina, but, as they lack the spinulose-mucronate leaflet apices and glandular pods, they are referred to A. karroo. It has been suggested by some collectors that the plants may be hybrids between A. karroo and A. tenuispina.

21. Acacia exuvialis Verdoorn in Bothalia 6:154, fig. 2 (1951); Codd, Trees & Shrubs Kruger Nat. Park: 52 (1951); Von Breitenbach, Indig. Trees S. Afr. 2:288 (1965); Brenan in F.Z. 3,1:90 (1970); Ross

in Bothalia 10: 351 (1971); Palmer & Pitman, Trees S. Afr. 2: 791 (1973). Type: Transvaal, Nelspruit Distr., Kruger National Park, 25,6 km W. of Skukuza, Codd & Verdoorn 5464 (PRE, holo.!).

Many stemmed shrub or small tree with slender ascending branches to 5 m high. Bark pale to dark yellowish- or greyishbrown, often oily in appearance, peeling in long strips; young branchlets reddish-brown to purplish-black, sometimes flaking, with some scattered inconspicuous dark sessile glands, often glutinous, glabrous or subglabrous. Stipules spinescent, in pairs, 0,4-7,7 cm long, straight or \pm deflexed, sometimes slightly enlarged and swollen, whitish, glabrous; other prickles absent. Leaves: petiole (0,3)0,8-1,5(2,4) cm long, adaxial gland usually absent; rhachis (0)0,7-2,4(4,7) cm long, glabrous or subglabrous, with a small sessile to shortly stipitate gland at the junction of each pinna pair, otherwise eglandular or with a few glands; pinnae scattered inconspicuous (1)2-4(6) pairs; rhachillae 0.6-2(3.3) cm long. glabrous or subglabrous; leaflets 3-6 pairs per pinna, $(2,4)4-7(10) \times 1,5-3(4,5)$ mm, linear-oblong to ovate- or obovate-oblong, margins entire, eglandular or almost so. glabrous. lateral nerves inconspicuous beneath, apex ± spinulose-mucronate. Inflorescences capitate, on axillary peduncles, solitary or fascicled along shoots of the current or previous season. Flowers bright yellow, sessile; peduncles (1,3)2-3(3,9) cm long, glabrous or subglabrous, glandular; involucel at or above the middle of the peduncle, 2-4 mm long. Calyx glabrous or subglabrous, tube 1,2-1,8 mm long, lobes up to 0,6 mm long. Corolla glabrous, tube 1,5-2,5 mm long, lobes up to 0,7 mm long, often reflexed. Stamen-filaments free, up to 4,5 mm long; anthers with a deciduous apical gland. Ovary shortly stipitate, up to 1,8 mm long, glabrous. Pods pale to dark yellowishor reddish-brown, 1,5-3,6(6,5) \times 0,4-0,9 cm, slightly to strongly falcate, somewhat torulose, subcoriaceous, venose, longitudinally dehiscent, eglandular or with few scattered glands, slightly glutinous, glabrous. Seeds olive-green to olive-brown, 5-8 \times 3,5-6 mm, elliptic, compressed; areole $3-5 \times 2,5-3$ mm.

Found in south-eastern Rhodesia and the eastern Transvaal. Occurs in mixed deciduous bush or woodland, often with Colophospermum mopane.

TRANSVAAL.—2331 (Phalaborwa): Kruger National Park, 5,6 km N.W. of Shingwedzi Camp, Codd & De Winter 5568. 2430 (Pilgrim's Rest): 3,2 km S. of Steelpoort, Morris 1183. 2431 (Acornhoek): Klaserie, Strey 7902. 2531 (Komatipoort): Kruger National Park, 15,2 km S. of Skukuza, Codd & Verdoorn 5502.

22. Acacia swazica Burtt Davy in Kew Bull. 1922: 332 (1922); Fl. Transv. 2: 342 (1932); Hutch., Botanist in S. Afr. 365, 370 (1946); Verdoorn in Bothalia 6: 156, fig. 6 (1951); Codd, Trees and Shrubs Kruger Nat. Park 51 (1951); Von Breitenbach, Indig. Trees S. Afr. 2: 290 (1965); Brenan in F.Z. 3,1: 92 (1970); Ross, Acacia Spp. Natal 41, fig. 2/18 (1971); in Bothalia 10: 351 (1971); Fl. Natal 193 (1973); Palmer & Pitman, Trees S. Afr. 2: 793 (1973). Type: Swaziland, near Manzini [Bremersdorp], Burtt Davy 3045 (PRE, holo.!, K, fragm.!; BM, iso.!).

A. glandulifera sensu Burtt Davy in Kew Bull. 1908: 158 (1908) pro parte quoad specim. Burtt Davy 3045, prope Bremersdorp, Swaziland; Henkel, Woody Pl. Natal 228 (1934), non Schinz sensu stricto. A. nebrownii sensu Burtt Davy in Kew Bull. 1921: 50 (1921) pro parte quoad Burtt Davy 3045, prope Bremersdorp, Swaziland, non Burtt Davy sensu stricto.

Slender shrub, often several stemmed, or small slender tree with short ascending branches up to 3 m high. Bark grey- to yellowish- or reddish-brown, sometimes flaking to reveal a yellowish inner layer; young branchlets grey- or reddish-brown to purplish. sometimes flaking minutely, glabrous except for scattered conspicuous reddish sessile pustular glands, often glutinous. Stipules spinescent, in pairs, 0,6-7,4 cm long, straight or slightly deflexed, slender, whitish, glabrous; other prickles absent. Leaves: petiole 0,3-1,9 cm long, glabrous or subglabrous, adaxial gland absent; rhachis 0-1,8(4,4) cm long, glabrous or subglabrous, often with a small sessile to shortly stipitate gland at the junction of each pinna pair, otherwise with small scattered glands; pinnae 1-3(5) pairs; rhachillae 0,6-2,9 cm long, glabrous, usually with small scattered glands; leaflets 3-7(9) pairs per pinna, (2)4-9(13) \times (1)1,5-5,1 mm, lanceolate to obovate-oblong or broadly obovate, glabrous, margins entire, eglandular or with few very inconspicuous glands towards the apex, lateral nerves ± prominent and conspicuous beneath, apex

spinulose-mucronate. Inflorescences capitate, on axillary peduncles, solitary or fascicled along shoots of the current or previous season. Flowers bright yellow, sessile or very shortly pedicellate; peduncles 1,4-4,7 cm long, glabrous or subglabrous, sparingly to densely glandular; involuced at or above the middle of the peduncle, large, 2-5 mm long. Calyx glabrous, tube 1,4-1,8 mm long, lobes up to 0,5 mm long. Corolla glabrous, tube 1,8-2,6 mm long, lobes up to 0,6 mm long. Stamen-filaments free, up to 4,8 mm long; anthers with a deciduous apical gland. Ovary shortly stipitate, glabrous, up to 1,8 mm long. Pods pale to dark yellowishor chestnut-brown, $(1,5)2-6 \times 0,7-1,2$ cm, slightly to strongly falcate, subcoriaceous, longitudinally dehiscent, numerous conspicuous dark sessile pustular glands, slightly glutinous, glabrous. Seeds olive to olive-brown, 4-7 × 4-6 mm, elliptic to subcircular, compressed; are ole $2.5-4 \times$ 2.5-4 mm.

Found in southern Mozambique, the eastern Transvaal, Swaziland and the north-western corner of Tongaland in the vicinity of Ndumu. Occurs in dry bushveld and mixed scrub, usually on boulder strewn slopes or in rocky situations.

TRANSVAAL.—2531 (Komatipoort): Kruger National Park, 1 km S.E. of Pretorius Kop (—AB), Codd 5682; 8 km E. of Kaapmuiden (—CB), Buitendag 783; Lebombo Flats, 24 km S. of Komatipoort (—DB), Strey 4025.

SWAZILAND.—2631 (Mbabane): near Manzini [Bremersdorp] (—AD), Burtt Davy 3045; Tulwane (—BC), Compton 31932; Grand Valley (—CD), Compton 29518. 2731 (Louwsburg): near Gollel, Rodin 4211 (K).

NATAL.—2632 (Bela Vista): 4,8 km S. of Abercorn Pont on road to Ndumu, Ross 1920.

A. swazica may sometimes be confused with A. exuvialis. However, A. swazica differs from A. exuvialis, and from all of the other species in the complex with glandular glutinous pods, by the conspicuous venation on the lower leaflet surfaces.

23. Acacia nebrownii Burtt Davy in Kew Bull. 1921: 50 (1921) pro parte excl. specim. Burtt Davy 3045, Swaziland, et Burtt Davy 5230, Potgietersrust, Transvaal; Bak.f., Leg. Trop. Afr. 3: 851 (1930); O. B. Miller, Checklist Bech. Prot. 20 (1948); in J. S. Afr. Bot. 18: 23 (1952); Verdoorn in Bothalia 6: 156, fig. 4 (1951); Schreiber in Mitt. Bot. Staatssamml. Munchen 2: 284 (1957); Von Breitenbach, Indig. Trees S. Afr. 2: 289 (1965); Leistner, Mem. Bot. Surv. S. Afr. 38: 123 (1967); Schreiber in F.S.W.A. 58: 10 (1967); Brenan in F.Z. 3,1: 92,

t.15/9 (1970); Ross in Bothalia 10: 351 (1971); Palmer & Pitman, Trees S. Afr. 2: 793 (1973). Syntypes: Botswana, Kwebe Hills, Mrs. E. J. Lugard 14 (K!) and 16 (K!).

A. glandulifera Schinz in Mém. Herb. Boiss. 1:111 (1900) nom. illegit., non A. glandulifera S. Wats. in Proc. Am. Acad. 25: 147 (1890); Burtt Davy in Kew Bull. 1908: 158 (1908) pro parte quoad Mrs. E. J. Lugard 14 & 16, excl. specim. Burtt Davy 3045 & 5230; Glover in Ann. Bolus Herb. 1: 149, t.18/9 (1915); Dinter in Feddes Repert. 15: 79 (1917). Syntypes: South West Africa, Great Namaqualand, Fleck 484a (Z!); Hereroland, Tsoachaub, Fleck 480a (Z!). A. rogersii Burtt Davy in Kew Bull. 1922: 331 (1922); in Fl. Transv. 2: 342 (1932); Bak.f., Leg. Trop. Afr. 3: 851 (1930); O. B. Miller, Checklist Bech. Prot. 21 (1948). Type: Transvaal, Soutpansberg Distr., Messina, Rogers 21843 (PRE, holo.!; K!, NH!, Z!). A. walteri Suesseng. in Mitt. Bot. Staatssamml. Munchen 1: 333 (1953). Syntypes as for A. glandulifera Schinz.

Many stemmed shrub with slender ascending branches or occasionally a slender tree to 4 m high. Bark reddish-brown to purplish-black; young branchlets yellowishor reddish-brown to purplish, sometimes as though whitewashed over a purple background, with numerous dark sessile pustular glands, sometimes glutinous, glabrous or subglabrous. Stipules spinescent, in pairs, 0,5-7 cm long, straight or slightly arcuate and deflexed, slender, whitish, tips usually reddish-brown; other prickles absent. Leaves: petiole 0,3-1,4 cm long, glabrous or subglabrous; rhachis 0-0,9 cm long, glabrous or subglabrous, a shortly columnar gland at the junction of the pinna pair; pinnae mostly 1 pair, rarely 3 pairs; rhachillae 0,5-1,4 cm long, glabrous or subglabrous, glandular; leaflets 3-5 pairs per pinna, 2,1-5,7 × 0,9-3(4) mm, linear-oblong to obovate or ovate, eglandular or with some small pale inconspicuous glands on the margin and sometimes the surface, glabrous, margins entire, apex usually shortly mucronate, lateral nerves inconspicuous beneath. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers bright yellow, sessile; peduncles 0,6-2,4 cm long, glabrous or subglabrous, glandular; involucel basal or up to $\frac{1}{3}$ -way up the peduncle. Calyx glabrous, tube 1-1,6 mm long, lobes up to 0,6 mm long. Corolla glabrous, tube 1,8-2,5 mm long, lobes up to 0,8 mm long, often reflexed. Stamen-filaments free, up to 5.5 mm long; anthers with a deciduous apical gland. Ovary shortly stipitate, up to 1,8 mm long,

glabrous. Pods pale to dark yellowish-brown or chestnut, $2-4(5,6) \times 0,6-1,3$ cm, slightly to strongly falcate, not or scarcely constricted between the seeds, with numerous conspicuous dark sessile pustular glands scattered over the surface, otherwise glabrous, longitudinally dehiscent, venose, apex obtuse, acute or mucronate. Seeds olive to olivebrown, $6-10 \times 5-7$ mm, elliptic, compressed; areole $4-6 \times 2,5-3,5$ mm.

Found in South West Africa, Botswana, the western portion of Rhodesia and north of the Soutpansberg in the Transvaal. Occurs in low lying sandfats, around pans or along river banks; in dry bush, thornveld or woodland, sometimes with Colophospermum mopane. Frequently forms thickets.

S.W.A.—1914 (Kamanjab): Kamanjab, Story 5649. 2218 (Gobabis): 24 km W. of Gobabis, Codd 5824. 2416 (Maltahöhe): farm Bullsport, Bullsport flats, Strey 2018. 2717 (Chamaites): Holoog, common on plateau and banks of Great Fish River, Pearson 9814 (K). 2718 (Grunau): 18,4 km S.S.E. of Narubis, Acocks 15563. Grid ref. unknown: Grootfontein District, farm Kumkauas, Kinges 2850; between Keetmanshoop and Aus, Gerstner 6291; Gurinaris, Pearson 9256 (K); without locality, Keet 1677.

24. Acacia permixta Burtt Davy in Kew Bull. 1922: 330 (1922) pro parte excl. var. glabra; Fl. Transv. 2: 340 (1932); Verdoorn in Bothalia 6: 155, fig. 3 (1951); Von Breitenbach, Indig. Trees S. Afr. 2: 289 (1965); Brenan in F.Z. 3,1: 91 (1970); Ross in Bothalia 10: 351 (1971); Palmer & Pitman, Trees S. Afr. 2: 791 (1973). Type: Transvaal, Potgietersrust, Burtt Davy 5230 (PRE, holo.!, K, fragm.!).

A. glandulifera sensu Burtt Davy in Kew Bull. 1908: 158 (1908) pro parte quoad specim. Burtt Davy 5230, Potgietersrust, non Schinz. A. nebrownii sensu Burtt Davy in Kew Bull. 1921: 50 (1921) pro parte quoad specim. Burtt Davy 5230, Potgietersrust, non Burtt Davy sensu stricto.

Many stemmed shrub or a small tree up to 4 m high with slender weakly ascending branches. Bark pale to dark chestnut or reddish-brown; young branchlets sparingly to densely hairy or tomentose with spreading grey to whitish hairs 0,75-2 mm long among which some conspicuous reddish sessile glands are scattered, epidermis sometimes splitting to reveal a reddish-brown inner layer. Stipules spinescent, in pairs, up to 6,5 cm long, straight or often slightly deflexed, slender, whitish, tips often reddish-brown;

other prickles absent. Leaves: petiole 0,3-1,7 cm long, sparingly to densely clothed with spreading hairs, adaxial gland absent: rhachis 0-4,2 cm long, sparingly to densely clothed with spreading hairs, with scattered conspicuous sessile reddish glands, a small raised columnar gland at the junction of the top 1-3 pinnae pairs or absent; pinnae 1-5(7) pairs; rhachillae 0,4-2,8 cm long, with irregularly scattered sessile reddish glands in amongst the spreading pubescence; leaflets 3-10 pairs per pinna, $2,2-7 \times 0,9-2(2,9)$ mm, linear- to obovate-oblong or obovate, eglandular or sometimes with a few glands on the margins towards the apex but margins crenulate, glabrous or sometimes sparingly pubescent below, margins with few to many spreading cilia, lateral nerves inconspicuous beneath, at least some leaflets spinulose-mucronate apically. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers bright vellow, sessile; peduncles 1,2-3(4,2) cm long, sparingly to densely clothed with spreading hairs, with scattered sessile reddish glands; involucel at or above the middle of the peduncle, 2,5-3,5 mm long. Calyx glabrous or sparingly pubescent especially on apices of the lobes, tube 1,4-2,2 mm long, lobes up to 0,7 mm long. Corolla glabrous or subglabrous, tube 2-3,2 mm long, lobes up to 0,9 mm long. Stamen-filaments free, up to 5 mm long; anthers with a deciduous apical gland. Ovary up to 1,8 mm long, shortly stipitate, glabrous. Pods pale to dark yellowish- or reddish-brown, $(2)2,7-5(8,9)\times0,6-1,4$ cm, slightly to strongly falcate, not or scarcely constricted between the seeds, with few to many conspicuous dark reddish-brown ± raised glands scattered over the surface, otherwise glabrous or subglabrous, longitudinally dehiscent, venose, apex obtuse, acute or sometimes mucronate. Seeds olive to olive-brown, 5-8 \times 4-6,5 mm, subcircular to elliptic, compressed; are ole $2-4 \times 1,5-2,5$

Found in south-western Rhodesia and the western Transvaal. Occurs in woodland, thorn scrub and grassland; usually on sandy or coarse gritty soils, often derived from granitic formations, particularly along the edges of the Pietersburg plateau.

TRANSVAAL.—2328 (Baltimore): 24 km S.E. of Villa Nora, *Codd 6581*. 2329 (Pietersburg): 40 km N. of Pietersburg on Kalkbank road, *Story 1558*. 2427 (Thabazimbi): 11,2 km N. of Maraheki, *Codd 5916*.

2527 (Rustenburg): 8 km N. of Beestekraal, Codd 2981.

A. permixta is readily distinguished from all of the other species in the complex with glandular glutinous pods by the spreading hairs on the young branchlets, leaf-rhachides and peduncles.

25. Acacia borleae Burtt Davy in Kew Bull. 1922: 325 (1922); Verdoorn in Bothalia 6: 154, fig. 1 (1951); Codd, Trees & Shrubs Kruger Nat. Park 41, fig. 34a (1951); Von Breitenbach, Indig. Trees S. Afr. 2: 287 (1965); Brenan in F.Z. 3, 1:90, t.15/8 (1970); Ross, Acacia Spp. Natal 23, fig. 217 (1971); in Bothalia 10: 351 (1971); Ross, Fl. Natal 192 (1973); Palmer & Pitman, Trees S. Afr. 2: 789 (1973). Type: Mozambique, Lourenco Marques, Borle 271 (PRE, holo.!; FHO!).

A. sp., Henkel, Woody Pl. Natal 229 (1934). A. barbertonensis Schweick. in Kew Bull. 1937: 445 (1937); Gerstner in J. S. Afr. Bot. 4: 57, fg. 2 (1938). Type: Transvaal, Barberton Distr., Komatipoort, Cotton Experimental Station, Barberton (K, holo.!;

PRE, fragm.!).

Many stemmed shrub with slender ascending branches or sometimes a slender tree, 1-5 m high. Bark dark reddish-brown to purplish-black or black, rough; young branchlets dark reddish-brown to blackish, flaking minutely, with numerous sessile glands, often glutinous, glabrous or subglabrous. Stipules spinescent, in pairs, 0,5-6,5 cm long, straight or slightly reflexed, slender, whitish, tips usually reddish-brown; other prickles absent. Leaves: petiole 0,5-1,8 cm long, adaxial gland often absent, sometimes a rather large sessile gland at or below the junction of the lowest pinna pair; rhachis (0) 2,5-4,7(6,8) cm long, glabrous or subglabrous, with a small sessile gland at the junction of the top 1-3 pinnae pairs, smaller scattered sessile glands present and sometimes numerous; pinnae (1)5-10(17) pairs; rhachillae 0,6-3,4 cm long, glabrous or subglabrous, glandular; leaflets (5)8-15 (18) pairs per pinna, $1,5-5 \times 0,8-2,2$ mm, linear-oblong, margins clearly crenulateglandular, surface glandular-punctate, glabrous, apex rounded to subacute or shortly spinulose-mucronate. *Inflorescences* capitate, on axillary peduncles, solitary or fascicled, forming terminal racemes. Flowers bright yellow, sessile; peduncles 1,6-3,4 cm long. glabrous or subglabrous, glandular; involucel at or above the middle of the peduncle. Calyx glabrous or subglabrous, tube 1,2-1,8 mm long, lobes up to 0,5 mm long. Corolla tubular, glabrous, tube 2-2,5 mm long, lobes up to 0,8 mm long, spreading slightly, often reflexed. Stamen-filaments free, up to 4,5 mm long; anthers with a deciduous apical gland. Ovary up to 1,4 mm long, shortly stipitate, glabrous. Pods dark brown to reddish-brown or blackish, 2,8-7,5(10) \times 0,5-0,8 cm, slightly to strongly falcate, often curled into an almost complete circle, moniliform. irregularly constricted between the seeds, with numerous sessile pustular glands on the surface, glutinous, longitudinally dehiscent, glabrous or subglabrous. Seeds olive-brown, 4.5–6 \times 3.5 — 5 mm, elliptic to subcircular, compressed; areole $2,5-4 \times 2,5-3,5 \text{ mm}$.

Occurs in south-eastern Rhodesia, the eastern Transvaal, southern Mozambique, Swaziland and Zululand. Found in mixed woodland and thornveld, usually in low lying areas on heavy soils or on rocky outcrops. Often gregarious and forming thickets.

TRANSVAAL.—2331 (Phalaborwa): Kruger National Park, Shingwedzi, Lamont 53. 2431 (Acornhoek): Kruger National Park, Skukuza, Van der Schifff 3420. 2531 (Komatipoort): Kruger National Park, 22,4 km N.E. of Pretorius Kop Camp, Codd 4312.

SWAZILAND.—2631 (Mbabane): 22,4 km W. of Stegi on road to Mbabane, *Codd & Dyer 2865*. 2731 (Louwsburg): Gollel, *Bayer sub NH 31431*.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, western area, Ross 661 (K, NH, NU). 2731 (Louwsburg): bridge over Mona River on Mkuze-Nongoma road, Ross 1058 (NU). 2732 (Ubombo): 14,4 km E. of Mhlosinga, farm Sutton, Strey 5671. 2831 (Nkandla): Umfolozi Game Reserve, road from Tobothi to Ngoloti, Ross 2019. 2832 (Mtubatuba): Somkele, Ward 2958.

A. borleae is easily distinguished from all of the other species in our area by the numerous sessile glands on the surface and margins of the leaflets.

In Rhodesia and Mozambique the young branchlets, leaflets and pods are frequently shortly puberulous, but in our area the puberulence is generally absent.

26. Acacia davyi N.E.Br. in Kew Bull. 1908: 161 (1908); Glover in Ann. Bolus Herb. 1: 150 (1915); Burtt Davy, Fl. Transv. 2: 346 (1932); Henkel, Woody Pl. Natal 227 (1934); Hutch., Botanist in S. Afr. 361 (1946); Von Breitenbach, Indig. Trees S. Afr. 2: 306 (1965); Brenan in F.Z. 3,1:89 (1970); Ross, Acacia Spp. Natal 27, fig. 2/13 (1971); Fl. Natal 193 (1973); in Bothalia 11:127 (1973); Palmer & Pitman, Trees S. Afr. 2:803 (1973). Syntypes: Transvaal, Houtbosch (Woodbush), Rehmann 6276 (BM!, K!, Z!); Burtt Davy 5132 (T.D.A. Herb. No. 1211) (PRE!);

Soutpansberg, Junod sub T.D.A. Herb. No. 1323 (PRE!). Swaziland, near Manzini [Bremersdorp], Burtt Davy 3024 (BM!, FHO!).

Shrub or small tree up to 5 m high. Bark vellow to vellowish-brown or brown, soft, corky, sometimes slightly papery, fissured; young branchlets creamy-white or yellowish to pale grey-brown or brown, glabrous to puberulous. Stipules spinescent, in pairs, 0,4-3 cm long, straight, slender, mostly ascending, glabrous or densely puberulous; other prickles absent. Leaves: petiole 0,3-0,9 cm long, glabrous to densely puberulous. adaxial gland often absent, when present usually just below the lowest pinna pair; rhachis (3,6)8-14(18) cm long, glabrous to densely puberulous, with a gland at the junction of the top 1-6 pinnae pairs; pinnae of well-developed leaves in 12-27 pairs (reduced leaves with as few as 8 pairs of pinnae sometimes also present); rhachillae 1,8-4,4(5,6) cm long; leaflets (17) 20-36(44) pairs per pinna, $1,9-6 \times 0,6-1$ mm, linear to linear-oblong, apex obtuse to subacute but not spinulose-mucronate, eglandular, margins glabrous or occasionally with few short cilia, usually glabrous below. Inflorescences capitate, on axillary peduncles, fascicled, borne along shoots of the current season and often aggregated into ± elongate terminal "racemes". Flowers bright-vellow. sessile; peduncles 0,8-3(6) cm long, glabrous to densely puberulous; involucel 1-2-way up the peduncle. Calvx glabrous except for pubescence on the lobes, especially apically, or sparingly puberulous throughout, tube 0.9-1.4 mm long, lobes up to 0.4 mm long. Corolla glabrous, tube 1,4-1,9 mm long, lobes up to 0,6 mm long. Stamen-filaments free, up to 4 mm long; anthers with a deciduous apical gland. Ovary up to 1,75 mm long, glabrous. Pods pale to dark yellowishbrown or brown, $(5)7-12(17) \times 0.5-0.8$ cm. linear, straight to slightly falcate, longitudinally dehiscent, not or somewhat constricted between the seeds, glabrous to sparingly puberulous, eglandular, flat, inconspicuously venose, sometimes irregularly swollen and pustulate from insect attack. Seeds olive- to dark-brown, 6-7,5 \times 3-5,5 mm, elliptic, compressed; areole 4-5 \times 2,5-3,5 mm.

Found in the Transvaal, southern Mozambique, Swaziland and Natal. Occurs in grassland, woodland, thornveld, bushveld and scrub; often on rocky slopes. A. davyi is seldom dominant to the exclusion of all other Acacia species except very locally.

TRANSVAAL.—2230 (Messina); Makonde, Van Warmelo 5115/20. 2329 (Pietersburg): slopes of Lajuma, Strey 7988. 2330 (Tzaneen): Duiwelskloof, Galpin 9407. 2430 (Pilgrim's Rest): Mariepskop, Van der Schijff 5016. 2431 (Acornhoek): Lothian, Strey 3326. 2530 (Lydenburg): 4,8 km S. of Nelspruit, Leach 11573. 2531 (Komatipoort): hillside adjoining Barberton, Codd 1589. 2731 (Louwsburg): 24 km from Pongola on road to Piet Retief, Grobbelaar 522.

SWAZILAND.—2631 (Mbabane): Mlilwane, Compton 31157. 2731 (Louwsburg): 3,2 km E. of Goedgegun on Hlatikulu road, farm Buckwood, Ross 1666.

NATAL.—2730 (Vryheid): road crossing Upper Blood River on Kingsley-Viljoenspos road, Edwards 2835. 2731 (Louwsburg): Ceza, Strey 9825. 2732 (Ubombo): 2,4 km from Ubombo on Ubombo-Mkuze road, summit of Lebombo Mts., Ross 264 (K, NH, NU). 2830 (Dundee): De Jagersdrif, Buffalo River valley between Dundee and Vryheid, Edwards 2838. 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 2472.

A tendency of A. davyi is for a few flowers to develop in the involucel on the peduncle, sometimes giving the appearance of a smaller secondary capitulum below the main one.

A. davyi bears a strong superficial resemblance to A. arenaria Schinz. A. arenaria differs, however, in having:

- white or pale pink flowers;
- the corolla usually 2-4 times as long as the small cupular calyx;
- 3. dark reddish-brown arcuate pods;
- 4. a very different distribution.

27. Acacia erioloba E. Mey., Comm. 1: 171 (1836), non A. erioloba Edgw. in J. Asiat. Soc. Beng. 16: 1215 (1847); Harv. in F.C. 2: 280 (1862); Engl. in Bot. Jahrb. 10: 22 (1888); Ross in Bothalia 11(4): 444 (1975). Type from Namaqualand (whereabouts unknown); Transvaal, Wolmaransstad Distr., between Kommandodrif and Makwassie, J. W. Morris 1042 (K, neo.!).

Mimosa sp. sensu Paterson, Journeys into Country of Hottentots & Caffraria: 133, tt.16, 17 (1789).

A. giraffae var. espinosa Kuntze in Jahrb. K. Bot. Gart. Mus. Berl. 4: 264 (1886). Type: South West Africa, Hereroland, Pechuel-Loesche (B, holo. †).

Tree up to 15 m high or less frequently a shrub to 4 m high; trunk to 1 m in diam.; crown rounded, the branches often drooping somewhat, or flattened and spreading, Bark dark greyish-brown to blackish, rough, fissured, often flaking off in thick ± woody sections when old; young branchlets pale to dark grey- or reddish-brown to purple, sometimes as though whitewashed over a purplish background, often flaking minutely, glabrous or subglabrous, seldom pubescent. Stipules spinescent, in pairs, 0,5-5(10) cm long, usually rather stout, often thickened below and fused together basally into an enlarged "ant-gall", $1,5-2 \times 2-2,5$ cm, sometimes furrowed down the middle, tapering to a sharp point apically; other prickles absent. Leaves: petiole 0,4-1,4 cm long, adaxial gland absent; rhachis (0)1-3,5(5,5) cm long, glabrous or subglabrous, a small gland at the junction of each pinna pair; pinnae (1)2-5(6) pairs; rhachillae (1,3)1,6-3,2(4,2) cm long, glabrous or subglabrous; leaflets (6)8-15(18) pairs per pinna, 4-11,5 \times (0,7)1,4-2,4(4) mm, linear-oblong to narrowly obovate, oblique basally, apex rounded to subacute, glabrous throughout or sometimes marginal cilia present, rarely pubescent below, lateral nerves prominent and conspicuous above and beneath. Inflorescences capitate, on axillary peduncles, solitary or fascicled, scattered along the shoots. Flowers bright golden-vellow, sessile or shortly pedicellate, (sometimes some flowers are male only); peduncles (1,8)2,3-4(5,5) cm long,

glabrous or subglabrous, eglandular; involucel apical. Calvx glabrous, sometimes apices of lobes with few glandular hairs, tube 1,5-2,2 mm long, lobes up to 0,6 mm long. Corolla glabrous or apices of lobes with glandular hairs, 2,7-3,6 mm long, lobes sometimes free for most of their length. Stamen-filaments free or connate into groups basally, up to 7,5 mm long; anthers with a deciduous apical gland. Ovary 1,2-2 mm long, sessile or shortly stipitate, glabrous at first but soon becoming pubescent. Pods densely grey-velutinous all over, with numerous minute dark reddish-brown to purplish glands particularly when young, (4)6-13 cm long, 1,8-5 cm wide, 0,8-2 cm thick, indehiscent, semi-woody, frequently semilunate to suborbicular, sometimes curled almost into a circle, apex rounded to acute or beaked, spongy within, seeds irregularly scattered but separated by transverse partitions. Seeds dark reddish-brown, 8-14 \times 7-10 mm, lenticular to elliptic, sometimes scarcely compressed; are ole $3-9 \times 2-5.5$

Found in Angola, South West Africa, Botswana, Zambia, south-western Rhodesia, the Transvaal, western Orange Free State and northern Cape Province. Occurs frequently on the Kalahari sands and in other areas where sandy soils are prevalent; in dry woodland, bush or thornveld. Often the dominant species in the Kalahari thornveld. In very dry areas it occurs along watercourses and in other situations where underground water is available.

S.W.A.—1713 (Swartbooisdrif): bank of Ososouu River at Otjivero, De Winter & Leistner 5361. 1724 (Katima Mulilo): 80 km from Katima Mulilo on road to Linyanti, Killich & Leistner 3141. 1816 (Namutoni): Ondonga, Rautanen 645 (GRA). 1819 (Karakuwisa): Omuramba bed, 27,2 km S. of Runtu on road to Karakuwisa, De Winter 3771. 1914 (Kamanjab): farm Beulah, near Kamanjab, De Winter 3105. 1917 (Tsumeb): 31 km S.W. of Otavi on road to Otjiwarongo, De Winter 2843. 2116 (Okahandja): Okahandja, Dinter 267 (GRA, K). 2117 (Otjosondu): Quickborn, Bradfield 11. 2214 (Swakopmund): near Goanikontes, Rodin 2154. 2216 (Otjimbingwe): farm Friedenau, 24,8 km in Khomas Hochland south west of Windhoek, De Winter 2590. 2415 (Sossusylei): Sesriem, Strey 2292 (BOL). 2616 (Aus): Aus, Dinter 6140 (K). 2618 (Keetmanshoop): Gobas, Pillans 5907 (BOL).

Unfortunately the familiar name A. giraffae Willd, can no longer be applied to this species (see Ross in Bothalia 11, 4: 443, 1975).

The combination of stout spines which are often enlarged into "ant-galls", leaflets with prominent venation, bright yellow flowers, glabrous peduncles, apical involucels and densely grey-velutinous pods enable A. erioloba to be easily distinguished from all other indigenous species.

Strey 2292 from the Rehoboth district of South West Africa is unusual in having distinctly coiled pods.

A. erioloba, commonly known as the "Camelthorn" or "Kameeldoring", was formerly much more abundant than it is today. In Burchell's time numerous large trees adorned the country in the northern Cape and north of the Orange River. However, with the opening of the diamond mines and railways there was a tremendous demand for the wood which, being hard and heavy, is an excellent fuel. Almost all of the large specimens within a radius of several hundred kilometres of Kimberley disappeared to provide fuel. Marloth, Fl. S. Afr. 2:54 (1925), reports that in one year alone 10 000 tons of the wood were forwarded to Kimberley from the Vryburg area. This large-scale destruction of A. erioloba from areas which are otherwise devoid of large trees is much regretted. A. erioloba is now protected in the northern Cape and in the Jacobsdal district of the Orange Free State.

In parts of the northern Cape, South West Africa and Botswana A. erioloba is still the only tree of any size to be seen for kilometres on end and it forms a very conspicuous feature of the landscape. In these areas the sociable weavers, Philetairus socius (Latham), frequently build their immense nests in trees of A. erioloba. These nests, which are used year after year and are continually added to, sometimes become so heavy that even the largest branches break under their weight.

Roots, probably of *A. erioloba*, have been reported at a depth of 45,72 m in a borehole in South West Africa (Mem. Bot. Surv. S. Afr. 27:117, 1952).

Coetzee in S. Afr. J. Sci. 52: 23 (1955) reports that the pollen-grains of A. erioloba are anomalous in consisting of 32 cells as opposed to the 16 cells in all other species studied.

A. erioloba hybridizes with A. haematoxylon.

28. Acacia haematoxylon Willd., Enum. Hort. Berol. 1056 (1809); DC., Prodr. 2:462 (1825); Harv. in F.C. 2:280 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 504 (1875); Engl. in Bot. Afr. 2: 773 (1973). Type: Interior of the Cape Province, Lichtenstein sub Herb. Willdenow 19186 (B, holo.).

A. atomiphylla Burch., Trav. 1:341 (1822). Type: Cape, Hopetown Distr., Asbestos mountains, at Kloof village, Burchell 1685 (K, holo.!).

Shrub or small tree to 10 m high; trunk to 0,3 m in diam.; crown often irregularly rounded, narrow, branches drooping somewhat. Bark dark greyish-brown to blackish, rough; young branchlets pale to dark grey or reddish-brown to purple, often appearing as though whitewashed over a purplish background, flaking minutely, slender. sparingly to densely grey-puberulous or tomentellous, seldom subglabrous. Stipules spinescent, in pairs, 0,5-5,7 cm long, slender, never inflated, straight, greyish-white to reddish-brown; other prickles absent. Leaves usually densely grey-tomentellous, bipinnate but the leaflets so small and laterally compressed that the pinnae resemble single linear crenulate leaflets: petiole 1-5(7) mm long, adaxial gland often absent; rhachis

0,8-5,1(8,2) cm long, with minute reddish glands scattered amongst the grey indumentum, a small vellowish-brown gland often present at the junction of the top 1-6 and the lowest 1-3 pinnae pairs or between each or most pairs; pinnae 6-26 pairs; rhachillae (0.3)0.5-1(1.5) cm long, with minute reddish glands scattered amongst the grey indumentum; leaflets grey, 12-24(35) pairs per pinna, $0,25-0,8 \times 0,2-0,5$ mm, oblong, tightly laterally compressed, superficially appearing simply pinnate, densely puberulous. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers bright goldenvellow, grey in bud, sessile, sometimes some flowers are male only; peduncles 1-2,4 cm long, densely grey-tomentellous, somewhat glandular; involucel at or above the middle or at the apex of the peduncle. Calyx 1,4-2 mm long, apices of lobes densely tomentellous, lobes shallow or free for most of their length. Corolla 1, 8-3 mm long, apices of lobes sparingly to densely tomentellous, lobes free almost to the base. Stamen-filaments free or connate into groups basally, up to 4,5 mm long; anthers with a deciduous apical gland. Ovary up to 1,5 mm long, sessile, glabrous at first but soon becoming pubescent. Pods grey-velutinous all over, with numerous minute dark reddish-brown to purplish glands particularly when young, 8-21 cm long, 0,6-1,4 cm wide, up to 0,9cm thick, indehiscent, falcate or curled into a complete circle, seldom straightish, margin entire or irregularly constricted between the seeds and ± moniliform, slightly spongy within. Seeds dark reddish- or purplish-brown, $8,5-11,5 \times 6-9$ mm, lenticular to elliptic, sometimes scarcely compressed; are ole $5-7 \times$ 3,5-5 mm, almost closed.

Restricted to South West Africa, south-western Botswana and the northern Cape Province. Occurs mostly on the Kalahari sands and in other areas where loose sandy soils are prevalent; in dry woodland, bush or thornveld. Often found on the sandy flats between the dunes or along dry watercourses.

Grid ref. unknown: Vryburg Distr., along Molopo River, De Winter 7831.

A very distinctive species which is easily recognized by its compact densely grey-tomentellous leaves with minute leaflets.

A. haematoxylon hybridizes with A. erioloba.

Lichtenstein, in his Travels in Southern Africa (1815), states that the wood of *A. haematoxylon* is of fine quality and suitable for the manufacture of musical instruments.

29. Acacia erioloba E. Mey. × Acacia haematoxylon Willd. Ross in Bothalia 11(4): 444 (1975).

A. giraffae Willd., Enum. Hort. Berol. 1054 (1809). Type: Interior of the Cape Province, Herb. Willdenow 19171 (B, holo.).

A. giraffae Willd. × A. haematoxylon Willd., Leistner, Mem. Bot. Surv. S. Afr. 38: 67, 123, t.24 (1967); Ross in Bothalia 10(2): 359 (1971); Robbertse in Proc. Electron Micros. Soc. S. Afr. 3: 29 (1973).

Tree to 7 m high; crown rounded. spreading, branches usually drooping somewhat; habit resembling that of A. erioloba. Bark dark greyish-brown to blackish, rough; young branchlets grey or reddish-brown to purplish, sometimes appearing as though whitewashed over a purplish background, glabrous to densely grey-tomentellous, glandular or eglandular. Stipules spinescent, in pairs, 0,3-5 cm long, slender but usually stouter than in A. haematoxylon, never inflated as in A. erioloba. Leaves distinctly bipinnate, sparingly to densely grey-tomentellous: petiole 2-9 mm long, adaxial gland absent; rhachis 0,9-4,8 cm long, with or without minute scattered glands, a small yellowish-brown gland often present at the junction of each pinna pair; pinnae 3-12 pairs; rhachillae 0,4-2,2 cm long, glandular or eglandular; leaflets greyish, 11-25 pairs per pinna, $1-4 \times 0.4-1.1$ mm, linear to linear-oblong, often slightly falcate, apex rounded to subacute, sparingly to densely puberulous above and below, lateral nerves not prominent. Inflorescences capitate, on axillary peduncles, solitary or sometimes fascicled. Flowers bright golden-yellow, grey in bud, sessile; peduncles 1-3 cm long, densely grey-tomentellous, glandular eglandular; involucel apical or a short distance below the apex of the peduncle. Calyx 1,8-2,4 mm long, apices of lobes sparingly to densely tomentellous, shallowly lobed or lobes free for \pm half their length. Corolla 2,2-3 mm long, apices of lobes sparingly to densely tomentellous, lobes free almost to the base. Stamen-filaments free or connate basally into groups of usually 3-6, up to 4,5 mm long. Ovary up to 2 mm long, sessile or shortly stipitate, glabrous at first but soon becoming pubescent. Pods densely grey-velutinous all over, numerous minute dark reddish-brown to purplish glands particularly when young, 7-14 cm long, 1,2-2,3 cm wide, up to 1 cm thick, falcate or curled into a complete circle, margin irregular, often constricted between the seeds and \pm moniliform, slightly spongy within, each seed separated by a thin transverse septum. Seeds dark reddish-brown, $9-12 \times 6-8$ mm, lenticularelliptic, sometimes subcircular, scarcely compressed; areole 6-8 \times 2,5-3,5 mm, almost closed.

Restricted to the northern Cape Province. Occurs on the Kalahari sands, often on the flats of loose sand between the hills; in dry woodland, bush or thornveld. Although specimens are relatively widespread in the northern Cape, they are nowhere common. Usually only a solitary plant is found or, at most, five or six individuals.

CAPE.—2520 (Mata Mata): Kalahari Gemsbok National Park, 14,4 km N. of Mata Mata, Leistner 1494. 2620 (Twee Rivieren): Kalahari Gemsbok National Park, 3,2 km S.E. of Kamkwa along Auob River, Leistner 3151 (KMG). 2722 (Olifantshoek): Moeswal Post Office, Langeberg Mts., Leistner 1782 2922 (Prieska): Bloubosfontein, 59 km N.N.W. of Prieska, Leistner 1340; 9,6 km W.S.W. of Abrahams Dam, Acocks 13190; Acocks 12689; Codd 1261. 2923 (Douglas): 14,4 km W.N.W. of Douglas, Leistner 1197.

This convincing hybrid is of great interest and a fuller account of it appears in Bothalia 10: 359 (1971).

Some of the characters displayed by the hybrid, for example, number of pinnae pairs and leaflet size, are intermediate between the values of A. erioloba and those of A. haematoxylon, while other characters, for example, the degree of pubescence and the presence of glands, are those exhibited by a single parent, namely, A. haematoxylon. The young branchlets, leaf-rhachides and peduncles in the hybrid are usually as densely pubescent as in A. haematoxylon and are not only

sparingly pubescent as an intermediate state between the glabrous A. erioloba and the densely pubescent A. heamatoxylon. Recombination of the characters of the two parent species apparently does not take place at random, but there is a marked tendency for characters associated together in one species to remain associated in the hybrid.

Although the parentage of the hybrid is known, it is not known which species functions as the male parent and which as the female parent. Furthermore, it is not known whether the same species is always, for example, the male parent or whether the same species may sometimes serve as the female parent. Consequently, there is at present no understanding of differences arising in the progeny as a result of this. As the hybrid is fertile it should be possible to find all stages of back-crossing with the parents. Careful field studies are required.

Tree to 10 m high; crown flattened, sometimes irregularly so, or rounded; trunk to 0,35 m in diam. Bark dark brownishblack to black, rough, longitudinally fissured: young branchlets greyish- or reddish-brown to purplish-black, often pinkish when young, sparingly to densely pubescent or occasionally subglabrous, glands inconspicuous or absent. Stipules spinescent, in pairs, 0,4-5,5(15) cm long, straight or almost so, often deflexed, whitish to grevish- or reddish-brown, sparingly to densely pubescent but becoming glabrescent with age; other prickles absent. Leaves: petiole 0,4-1,2(2,4) cm long, sparingly to densely pubescent or occasionally subglabrous, adaxial gland usually present, sometimes two present, often a short distance below the lowest pinna pair, up to $1.8 \times$ 0.8 mm; rhachis (1.2)2.7-5.8(8) cm long, sparingly to densely pubescent or occasionally subglabrous, with a gland at the junction of each pinna pair or between the top few pairs only; pinnae (3)5-11(14) pairs; rhachillae 0,9-2, 8 (4,4) cm long; leaflets 12-27(36) pairs per pinna, $1,5-5,5 \times 0,5-1,5 \text{ mm}$, linear to linear-oblong, apex rounded to subacute but not spinulose-mucronate, margins usually sparsely to densely ciliate, glabrous above and below or rarely puberulous below. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers bright-yellow, sessile; peduncles 1,2-4,5 cm long, sparingly to densely pubescent, rarely subglabrous; involucel from near the base to just over halfway up the peduncle. Calyx glabrous to densely pubescent, expecially apically, tube 0,8-1,6 mm long, lobes up to 0,4 mm long. Corolla glabrous to pubescent, especially apically, tube 2-2,6 mm long, lobes up to 1,1 mm long, often reflexed. Stamen-filaments

free or sometimes united into bundles basally, up to 5 mm long; anthers with a deciduous apical gland. Ovary up to 1.1 mm long, sessile or shortly stipitate, glabrous but soon becoming pubescent. Pods green and fleshy when young but shrivelling and turning black with age, $(5,2)8-17(19,5) \times$ 0,9-1,6(1,9) cm, oblong, straight or slightly falcate, margins shallowly to deeply crenate between each seed, each joint marked with a distinct raised bump which corresponds to the seed inside, sparingly to densely pubescent all over at first but the raised parts over the seeds becoming glabrescent and shining with age, rarely subglabrous throughout, sweet-smelling, indehiscent, breaking up transversely into segments on the ground. Seeds olive-brown, $6.5-9 \times 5-8$ mm. subcircular, scarcely compressed; areole 5-7 \times 4–7 mm.

Found from Tanzania southwards to the Transvaal, Swaziland and Natal. Occurs in dry thornveld, river valley scrub, woodland, bushveld and scrub.

S.W.A.—1713 (Swartbooisdrift): 22,4 km N. of Otijhangasems (11,2 km N. of Omuhonga River), Giess 9355 (M). 1716 (Enana): 19 km S.W. of Omafa on road to Ndola store, De Winter 3626. 1813 (Ohopoho): 3,2 km E. of Ohopoho, De Winter & Leistner 5311. 1916 (Gobaub): farm Pierre, Outjo-Otavi road, Tölken & Hardy 895. 1917 (Tsumeb): 7,5 km E. of Otavi on road to Grootfontein, De Winter 2859, 1918 (Grootfontein): farm Welgemoed, Merxmuller & Giess 2165. 2016 (Otjiwarongo): Omatjenne, Volk 2937.

A. nilotica subsp. kraussiana occupies a wide range of habitats and is consequently rather variable. The pods, in particular, show considerable variation. Schreiber in F.S.W.A. 58: 11 (1967) referred all of the South West African material of A. nilotica to subsp. subalata (Vatke) Brenan. However, after examining the specimens and comparing them with the Kew collections of typical subsp. subalata from East Africa, it is felt that the South West African specimens are better placed in subsp. kraussiana. It is extremely difficult to differentiate concisely in words between subsp. kraussiana and subsp. subalata, and some specimens of subsp. kraussiana certainly do approach subsp. subalata, particularly when the pods are immature.

In northern Zululand, and especially in Tongaland, the paired spines are frequently greatly elongated, so much so in some instances that they cause the young branchlets to droop. From the vicinity of Hluti in Swaziland to just north of Mkuze in Zululand there appears to be a tendency for the occurrence of plants with ±glabrous young branchlets and pods.

A tendency of A. nilotica is for a few flowers to develop in the involucel on the peduncle, sometimes giving the appearance of a smaller secondary capitulum below the main one. The flowers in this secondary capitulum often develop before those in the main capitulum. A specimen from the Skukuza area of the Kruger National Park (Van der Schifff 4009) is unusual in that a few of the peduncles are forked either at or some distance above the involucel and each limb bears a capitulum of flowers.

A good quality gum, at one time used for confectionery and for adhesive purposes, is exuded from the stems. The wood is reddish-brown with a darker heartwood, close-grained, very hard, durable and termite-proof. It is consequently useful for fencing posts and also provides a good fuel.

31. Acacia xanthophloea Benth. in Trans. Linn. Soc. Lond. 30: 511 (1875); Burtt Davy in Kew Bull. 1908: 160 (1908) pro parte excl. specim. Elliott 163; Sim, For. Fl. P.E. Afr. 58, t.41 (1909); Glover in Ann. Bolus Herb. 1: 150 (1915); Eyles in Trans. Roy. Soc. S. Afr. 5: 363 (1916); Bews, Fl.

Trees 60 (1966); Brenan in F.Z. 3,1:96, t.20 (1970); Ross, Acacia Spp. Natal 43, fig. 2/7 (1971); Flow. Pl. Afr. 41 : t.1637 (1971); Van Wyk, Trees Kruger Nat. Park 1: 167 (1972); Ross, Fl. Natal 193 (1973); Palmer & Pitman, Trees S. Afr. 2: 815 (1973). Syntypes: Malawi, E. end of Lake Shirwa [Chilwa], Meller (K!); Mozambique, Sena, Kirk (K!).

Tree up to 30 m high with a rounded or flattened and somewhat spreading crown. Bark on trunk lemon to greenish-yellow, flaking minutely, becoming powdery, dark brown to black where damaged; young branchlets lemon to greenish-vellow, powdery, glabrous or subglabrous, young extremities brown to plum-coloured but the outer layer soon flaking off to reveal the greenishyellow inner layer. Stipules spinescent, in pairs, 0,9-8,5 cm long, straight or almost so; "ant-galls" and other prickles absent. Leaves: petiole 0,1-1,5 cm long, glabrous to sparingly pubescent, adaxial gland usually present, variable in position, up to 1.5×1 mm; rhachis (0)2,5-7 cm long, glabrous to sparingly pubescent, a gland often present at the junction of the top 1-2 pinna pairs: pinnae (1)3-6(8) pairs; rhachillae 0.3-3 cm long; leaflets 8–17 pairs per pinna, $2.5-6.5 \times$ 0,75-1,75 mm, linear to linear-oblong, apex rounded to acute or mucronate, margins usually without cilia, glabrous beneath, lateral nerves invisible beneath. Inflorescences capitate, usually on abbreviated lateral shoots whose axes do not elongate and are represented by clustered scales, the peduncles thus appearing to be in lateral fascicles on the older yellow-barked twigs. Flowers bright yellow (at least in our area), sessile; peduncles 0,8-2,9 cm long, sparingly to densely pubescent or subglabrous, glandular chiefly

below the involucel but sometimes also above; involucel basal to about halfway up the peduncle, conspicuous, 2-4 mm long. Calyx glabrous or sometimes lobes very sparingly puberulous, tube 0, 8-1, 6 mm long, lobes minute, up to 0,2 mm long. Corolla often deep pink to purplish apically especially when in bud, glabrous, tube 2,4-3,2 mm long, lobes up to 0,5 mm long. Stamen-filaments free, up to 7 mm long; anthers with a deciduous apical gland. Ovary up to 1,8 mm long, sessile, with few to many long glandular hairs. Pods yellowish-brown to brown, 3,4- $13.5 \times 0.7-1.4$ cm, linear-oblong, straight or slightly curved, + moniliform or irregularly constricted between some of the seeds, the segments mostly ± as long as wide, indehiscent, breaking up transversely into segments after being shed, valves thin, coriaceous, reticulate-venose, glabrous or almost so, eglandular or sparingly glandular. Seeds olive to blackish-olive, $4,5-6,5 \times 3,5-5$ mm, subcircular to elliptic, compressed; areole $3-4.5 \times 2-3$ mm.

Found from Kenya southwards to the Transvaal, Swaziland and Zululand. Occurs along river banks, in seasonally flooded areas adjacent to rivers, on the margins of lakes and shallow pans where water collects after rain, and in low lying areas where underground water is available. Often gregarious and at times forming a closed woodland.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, Makuleka, Lang sub TRV 32250. 2531 (Komatipoort): Kruger National Park, 4,8 km N.W. of Crocodile Bridge, Codd 5710; Komatipoort, Burtt Davy 365.

SWAZILAND.—2631 (Mbabane): Stegi-Big Bend road, *Compton 28042*. 2731 (Louwsburg): 22,4 km N. of Gollel on Nsoko road, *Ross 1551*.

A. xanthophloea, with its greenish-yellow bark, is a most distinctive species. On account of its preference for moist or swampy situations, which also form the breeding places of the malaria carrying mosquito, the species has always been associated with fever, whence the common name "Fever Tree".

Brenan in F.T.E.A. Legum.-Mimos.: 108 (1959) records that A. xanthophloea is "apparently unique among the East African acacias in having flowers either white to pinkish or purplish, or else yellow to golden." White to purplish flowers appear to be confined to Kenya and Tanzania. Although the corollas of many of our specimens are pinkish or even purple, the stamens are bright yellow and the flowers therefore appear bright yellow. At present there is no evidence to suggest that any flower colour other than bright or golden yellow occurs in our area.

A. xanthophloea achieved fame and is known to generations of children through Rudyard Kipling's "Just So Stories" and the adventures of the Elephant's Child who travelled "till he came at last to the banks of the great, grey-green, greasy Limpopo River, all set about with fever trees".

32. Acacia kirkii Oliv. in F.T.A. 2: 350 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 507 (1875); Brenan in Kew Bull. 12: 361 (1958); in F.T.E.A. Legum.-Mimos.: 106 (1959). Type: Zambia, Southern Province, Batoka country, Kirk (K, holo.!).

subsp. kirkii.

A. harmsiana Dinter in Feddes Repert. 15:80 (1917); Bak.f., Leg. Trop. Afr. 3:848 (1930). Type: South West Africa, Tsumeb Distr., Nagusib, 25 km S.E. of Namutoni, Dinter 2283 (SAM, iso.!). A. nilotica (L.) Del. subsp. adstringens (Schumach. & Thonn.) Roberty var. kirkii (Oliv.) Roberty in Candollea 11:151 (1948) pro parte. Type as for A. kirkii.

Tree to 10 m high or a many stemmed shrub branching from near the base, branches slender, ascending, crown ± flattened and spreading somewhat. Bark grey or yellowishbrown, often with numerous transversely elongated lenticels, papery, flaking or peeling off to reveal a yellowish-green inner layer; young branchlets grey, brown or reddishto purplish-brown, subglabrous or puberulous, with numerous sessile reddish glands. Stipules spinescent, in pairs, 0,5-4,5(8) cm long, straight or almost so, usually greyishwhite; "ant-galls" and other prickles absent. Leaves: petiole 0,3-1,3 cm long, subglabrous to densely pubescent, adaxial gland usually absent; rhachis (0,8)3-6(7,2) cm long, subglabrous to densely pubescent, a small rounded or oval gland at the junction of the top 1-3 pinnae pairs only, or absent; pinnae

(3)6-14 pairs; rhachillae 0,8-2,1 cm long, subglabrous to densely pubescent; leaflets 9-18 pairs per pinna, 2-5 × 0,5-1,25 mm, narrowly oblong or linear-oblong, apex acute to minutely mucronate, glabrous below, margins with or without cilia. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers sessile, pinkish-red in bud, cream or white when open; peduncles 1,8-3,7 cm long, usually densely pubescent and with sessile glands throughout, rarely sparingly pubescent; involucel conspicuous, 2-3 mm long, below, at or slightly above the middle of the peduncle. Calyx cream and tinged with pinkish-red, or pinkish-red, sparingly to densely pubescent apically especially on the lobes, tube up to 1,6 mm long, lobes up to 0,8 mm long. Corolla pinkish-red, glabrous or subglabrous, tube 1,8-2,4 mm long, lobes up to 1 mm long. Stamen-filaments white, free, up to 6 mm long; anthers with a deciduous apical gland. Ovary up to 1,2 mm long, sessile, glabrous. *Pods* brown or reddish-brown, (2)3,5–8(10) \times (0,8)1,3-2,1 cm, oblong, straight or almost so (sometimes bent in a plane at right angles to the flattened plane of the pod), mostly ± moniliform with the segments as wide as or wider than long, stipe up to 1,5 cm long, apex rounded to mucronate, usually prominently venose, indehiscent, fibrous and tough, each segment with a small or medium irregular wart-like projection up to 5 mm long in the centre of each of its flat sides. glabrous or subglabrous. Seeds olive or olive-brown, $5-8 \times 4-5,5$ mm, subcircular to elliptic, compressed; areole 3,5-5 × 2,5-3,5 mm.

Found in Uganda, Kenya, Tanzania, Zambia, Rhodesia, Angola, northern South West Africa and Botswana. Occurs in woodland, wooded grassland, mixed bush and scrub, often in seasonally flooded alluvium by rivers and pans. Often grows in association with Colophospermum mopane.

S.W.A.—1713 (Swartbooisdrift): Handungo, 14,4 km N.W. of Ombazu on road to Swartbooisdrift, De Winter & Leistner 5896, 1725 (Livingstone): Mpilila Island, confluence of Zambezi and Choberivers, Killick & Leistner 3382. 1814 (Otjitundua): Otjitoko, ± 56 km S. of Ohopoho, De Winter & Leistner 5912. 1817 (Tsintsabis): 89 km N.W. of

Tsumeb on road to Namutoni, *De Winter 2957*.

33. Acacia tortilis (*Forsk.*) *Hayne*,
Arzneyk. Gebr. Gewächse 10: t.31 (1827);
Oliv. in F.T.A. 2: 352 (1871); Benth. in
Trans. Linn. Soc. Lond. 30: 506 (1875);
Bak.f., Leg. Trop. Afr. 3: 841 (1930);

Torre in C.F.A. 2: 284 (1956); Brenan in Kew Bull. 12: 86 (1957); in F.T.E.A. Legum-Mimos.: 117 (1959); F. White, For. Fl.N. Rhod. 84, fig 17J (1962); Brenan in F.Z. 3, 1: 102 (1970). Type: Arabia, "Mons Soudân prope Hás", Forskal (C, holo.).

Mimosa tortilis Forsk., Fl. Aegypt. Arab. CXXIII, 176 (1775). Type as above.

Tree to 15 m high or a small shrub or bush, crown typically flattened and spreading, sometimes rounded; trunk to 1 m in diam. Bark grey to grey-brown or blackish, at times reddish-brown, rough, fissured, seldom + smooth; young branchlets grevish- to reddishbrown or purplish-black, glabrous to densely pubescent, lenticellate, often flaking minutely. Stipules spinescent, some short, hooked and up to 5 mm long, mixed with other long straight slender whitish spines 1.5-10 cm long; "ant-galls" and other prickles absent. Leaves: petiole 0,2-0,8(1,4) cm long, sparingly to densely pubescent, adaxial gland usually present and just below lowest pinna pair; rhachis 0,2-2(4,6) cm long, sparingly to densely pubescent, eglandular or sparingly glandular, a small gland often present at the junction of the top 1-3 and lowest 1-2 pinnae pairs or absent from some, variable; pinnae 2-10(14) pairs; rhachillae 0,3-1,7 cm long, sparingly to densely pubescent; leaflets 6-22 pairs per pinna, $1-4 \times 0.6-1$ mm, linear to linear-oblong, apex rounded to acute, glabrous or sparingly to densely appressed-pubescent beneath and sometimes also above, indumentum often concentrated along midrib beneath. margins with or without cilia. Inflorescences capitate, on axillary peduncles, fascicled or solitary. Flowers white to pale yellowishwhite, sessile; peduncles 0,4-2,4 cm long, sparingly to densely pubescent; involucel in lower third of peduncle. Calyx glabrous except for the lobes which are sparingly to densely pubescent, tube 0,9-1,6 mm long, lobes up to 0,8 mm long. Corolla glabrous throughout or apices of lobes sparingly to densely pubescent, tube 1,2-2 mm long, lobes up to 1 mm long. Stamen-filaments free, up to 4,5 mm long; anthers with a deciduous apical gland. Ovary glabrous, up to 1,5 mm long, shortly stipitate. Pods variously contorted or spirally twisted, 0,6-1,2 cm wide, greenish-yellow to olivebrown, longitudinally veined, indehiscent or very tardily dehiscent on the ground

usually glabrous but at times sparingly to densely pubescent, eglandular or with few to many minute scattered reddish glands. Seeds olive- to reddish-brown, $4-7 \times 3-6$ mm, elliptic to subcircular, smooth, compressed; areole $3-6 \times 2-4$ mm.

A. tortilis is widespread throughout Africa and Arabia. Four subspecies are recognized, two of which occur in our area.

Young branchlets shortly pubescent with hairs usually less than 0,25 mm long, a few to 0,5 mm; petiole and leaf-rhachis similarly shortly pubescent; pods glabrous or almost so, eglandular..........(a) subsp. heteracantha

Young branchlets with longer denser pubescence than in subsp. heteracantha, hairs 0,25-0,75 mm long; petiole and leaf-rhachis with hairs mostly more than 0,25 mm long; pods tomentellous or pubescent with spreading or curved hairs among which numerous dark reddish glands are clearly visible through a hand lens.....(b) subsp. spirocarpa

A. tortilis with its mixture of short recurved spines and long straight spines and its spirally twisted or variously contorted pods is a very distinctive species. Typical subsp. tortilis, with narrow (3-5 mm wide) pubescent but eglandular pods, occurs in Egypt, the Sudan, Arabia, Aden and perhaps Israel.

(a) subsp. heteracantha (Burch.) Brenan in Kew Bull. 12: 88 (1957); in Kew Bull. 13: 409 (1959); Palmer & Pitman, Trees S. Afr. 165, t.xi, 46, 47 (1961); Von Breitenbach, Indig. Trees S. The mixture of short and long spines accounts for the vernacular name "Haak en Steek". The typically flattened spreading crown, on the other hand, accounts for subsp. heteracantha also being referred to

as the Umbrella Thorn.

De Winter 2719 from 69 km N. of Okahandja on road to Otjiwarongo in South West Africa is difficult to place with certainty. The young branchlets, petioles and leaf-rhachides have the short indumentum of subsp. heteracantha but the pods are sparsely clothed with short hairs among which some dark reddish glands are visible. Tölken & Hardy 687 from 20 km from Bullsport on road to Ababis is similar. Both specimens seem to be best referred to subsp. heteracantha.

The leaves and pods make an excellent fodder. The wood, however, is of little use except for firewood.

(b) subsp. spirocarpa (Hochst. ex A. Rich.) Brenan in Kew Bull. 12: 88 (1957); in F.T.E.A. Legum.—Mimos.: 117, fig. 16/44 (1959); in F.Z. 3,1: 102 (1970); Schreiber in Mitt. Bot. Staatssamml. Munchen 11: 124 (1973). Syntypes: Ethiopia, near Djeladjeranne [Dscheladscheranne], Schimper 502 (BM!, FI!, K!, M!, P!, Z!); Schimper 612 (BM!, FI!, K!, M!, P!); Schimper 658 (BM!, FI!, K!, M!, OXF!, P!, Z!).

A. spirocarpa Hochst. ex A. Rich., Tent. Fl. Abyss. 1:239 (1847); Schweinf. in Linnaea 35:322 (1867–8); Oliv. in F.T.A. 2:352 (1871); Benth. in Trans. Linn. Soc. Lond. 30:505 (1875); Bak.f., Leg. Trop. Afr. 3:842 (1930); O. B. Miller in J. S. Afr. Bot. 18:25 (1952). Syntypes as above.

Found in Ethiopia and the Sudan southwards to Angola, South West Africa, Botswana, Rhodesia, and Mozambique. Occurs in deciduous woodland and

dry scrub.

S.W.A.—1917 (Tsumeb): Tsumeb (—BA), Giess, Volk & Bleissner 6442 (M). 2017 (Waterberg): Waterberg, below Police station (—CA), Giess 12349 (K, M).

The pods of Giess 12349 are densely clothed with whitish spreading hairs 1-2 mm long and show a very close approach to var. crinita Chiov. in Res. Sci. Miss. Stefanini-Paoli 1: 71 (1916). Var. crinita is recorded from Somalia, Kenya and Tanzania.

34. Acacia luederitzii Engl. in Bot. Jahrb. 10: 23, t.3B (July 1888) pro parte quoad specim. Marloth 1328; Schinz in Mém. Herb. Boiss. 1: 115 (1900) pro parte quoad specim. Marloth 1328; Dinter in Feddes Repert. 15: 80 (1917) pro parte quoad specim. Marloth 1328; Bak.f., Leg. Trop. Afr. 3: 840 (1930); Brenan in F.Z. 3,1: 101 (1970); Schreiber in Mitt. Bot. Staatssamml. Munchen 11: 119 (1973); Ross in Bothalia 11: 233 (1974). Type: South West Africa, Otjimbingwe, Marloth 1328 (PRE lecto!; GRA!, M!, OXF!).

Shrub branching from or near the base or a tree to 15 m high with a flattened and spreading or somewhat rounded crown. Bark greyish- or reddish-brown to black, rough, longitudinally fissured on older trunks, often + smooth on younger stems; young branchlets greyish- or reddish-brown to purplish or blackish, flaking minutely, densely clothed with grey or whitish spreading hairs, older branchlets glabrescent. Stipules spinescent, in pairs, some short and strongly hooked, 3-10 mm long, usually intermixed with some elongate, slender and straight or slightly curved spines 1-7 cm long or some inflated spines ("ant-galls") up to 1,8 cm in diam. basally, \pm bent towards the apex, greyish-white to purplish, sometimes all spines short and hooked; other prickles absent. Leaves: petiole 0,3-1,4 cm long, sparingly to densely spreading-pubescent, adaxial gland often absent, usually just below the lowest pinna pair when present, $0.4-0.9\times0.2-0.5$ mm; rhachis 0,7-4,8 cm long, sparingly to densely clothed with spreading hairs, eglandular or with a small gland at the junction of the top 1-3(5) pinnae pairs; pinnae 3-9(13) pairs; rhachillae 0,7-2,8 cm long, sparingly to densely clothed with spreading hairs; leaflets 11-26 pairs per pinna, $2-5 \times 0, 5-1, 5$ mm, linear-oblong or the terminal ones slightly obovate-oblong, apex rounded or obtuse, margins with conspicuous spreading cilia, especially apically, seldom cilia ±

inconspicuous, otherwise glabrous or sometimes ± pubescent beneath. Inflorescences capitate, on axillary peduncles, usually fascicled, seldom solitary. Flowers vellowishwhite, sessile; peduncles 1,2-4,3 cm long, sparingly to densely pubescent, hairs spreading but shorter than the diameter of the peduncle; involucel $\frac{1}{5}$ - $\frac{2}{3}$ -way up the peduncle. Calyx shortly pubescent or puberulous apically, tube 0,8-1,3 mm long, lobes up to 0,4 mm long. Corolla glabrous, tube 2,2-3,2 mm long, lobes up to 0,5 mm long. Stamenfilaments free, up to 6,5 mm long; anthers with a deciduous apical gland. Ovary up to 1,2 mm long, very shortly stipitate. *Pods* brown or reddish-brown to purplish, $3.2-13 \times (0.9)1-1.9$ cm, straight or sometimes slightly curved, linear-oblong, longitudinally dehiscent, valves rather thin, brittle, longitudinally or obliquely veined, attenuate basally, rounded to acuminate apically. finely puberulous especially on the margins and near the base, sometimes subglabrous. Seeds olive-brown, $5.5-11.5 \times 5-8$ mm, elliptic to subcircular, usually longitudinal in the pod, smooth, compressed; areole $3-7 \times 2,75-5 \text{ mm}.$

Found in South West Africa, Botswana, western Zambia, Rhodesia, Mozambique, the Transvaal, Swaziland, Natal and the northern Cape Province.

Larger spines elongate, 1-7 cm long, 1,5-5 mm thick, straight or almost so, not inflated; found in South West Africa and the northern Cape.............(a) var. luederitzii

Larger spines 3-5,5 cm long, 0,8-1,8 cm in diam. basally, inflated, usually±uncinate-deflexed near the apex; straight elongate non-inflated spines absent; found in the Transvaal, Swaziland and Natal...(b) var. retinens

(a) var. luederitzii.

Ross & Brenan in Kew Bull. 21: 72 (1967); Brenan in F.Z. 3,1: 101, t.16/14 (1970); Palmer & Pitman, Trees S. Afr. 2: 811 (1973).

A. luederitzii Engl. in Bot. Jahrb. 10: 23, t.3B (1888) pro parte quoad specim. Marloth 1328. A. goeringii Schinz in Verh. Bot. Ver. Prov. Brandenb. 30: 239 (Sept. 1888); Dinter in Feddes Repert. 15: 79 (1917); Bak.f., Leg. Trop. Afr. 3: 841(1930); O. B. Miller, Checklist Bech. Prot. 18 (1948); in J. S. Afr. Bot. 18: 21 (1952). Type: Botswana, Ghanzi [Chansis], Schinz 251 (Z, holo.!). A. retinens sensu O. B. Miller, Checklist Bech. Prot. 20 (1948); in J. S. Afr. Bot. 18: 24 (1952); Tinley, Moremi Wildlife Reserve 115 (1966), non Sim. A. uncinata sensu O. B. Miller in J. S. Afr. Bot. 18: 25 (1952); Story in Mem. Bot. Surv. S. Afr. 30: 23 (1958); Boughey in J. S. Afr. Bot. 30: 158 (1964), non Engl. A. reficiens sensu

Schreiber in F.S.W.A. 58: 11 (1967) pro parte; Leistner in Mem. Bot. Surv. S. Afr. 38: 123 (1967), non Wawra.

Found in South West Africa, Botswana, western Zambia, Rhodesia and the northern Cape Province. Occurs in savanna, bush and thornveld, particularly on Kalahari Sand.

S.W.A.—1715 (Ondangua): 24 km W. of Ndola Store on road to Ombalantu, De Winter 3631. 1718 (Kuring-Kuru): course of Omuramba Mpungu on Tsinsabis-Kuring-Kuru road, De Winter 3921. 1719 (Runtu): 8 km E. of Runtu, Barnard 51. 1816 (Namutoni): N. of Namutoni, Giess & Smook 10570 (M). 1917 (Tsumeb): Otarifontein, Dinter 5365. 1920 (Tsumkwe): 16 km S. of Tsumkwe, Giess 9908 (M, W). 2017 (Waterberg): Okakarara, Liebenberg 4697. 2117 (Otjosondu): Quickborn, Bradfield 19. 2118 (Steinhausen): Sturmfeld, Walter 4084 (M). 2216 (Otjimbingwe): farm Otjiseva, Wiss 946. 2219 (Sandfontein): Babi Babi, Liebenberg 4677. 2319 (Aminuis): 25,6 km N.E. of Vogelweide, Codd 5858. 2419 (Aranos): farm Bethel, E. of Aranos, 9,6 km from Botswana border, Van Vuuren & Giess 1129.

CAPE.—2520 (Mata-Mata): Kalahari Gemsbok National Park, 14,4 km N.W. of Kwang Pan near Nossob River, Leistner 1890. 2524 (Vergeleē): 134,4 km W. of Mafeking, Acocks 18767. 2622 (Tsabong): 32 km N. of Aansluit on road to Tsabong, Leistner 1574. 2624 (Vryburg): near Mosito, Breuckner 260.

(b) var. retinens (Sim) Ross & Brenan in Kew Bull. 21: 72 (1967); Brenan in F.Z. 3,1: 101 (1970); Ross, Acacia Spp. Natal 34, fig. 2/12 (1971); Van Wyk, Trees Kruger Nat. Park 1: 145 (1972); Ross, Fl. Natal 193 (1973); Palmer & Pitman, Trees S. Afr. 2: 813 (1973). Type: Mozambique, "Umbeluzi and Lebombo", Sim 6391 (whereabouts unknown, presumed lost). In the absence of a specimen, Sim l.c.: t.40 fig. A will suffice as the type.

A. retinens Sim, For. Fl. P.E. Afr. 157, t.40 fig. A (1909); Henkel, Woody Pl. Natal 230 (1934); O. B. Miller, Checklist Bech. Prot. 20 (1948); Ross in J. S. Afr. Bot. 31: 219 (1965); Von Breitenbach, Indig. Trees S. Afr. 2: 307 (1965). Type as above. A. gillettiae Burtt Davy, Fl. Transv. 2: xvii, 343 (1932); O. B. Miller, Checklist Bech. Prot. 18 (1948); in J.S. Afr. Bot. 18: 21 (1952); Von Breitenbach, Indig. Trees S. Afr. 2: 306 (1965). Type: Transvaal, Mosdene, Naboomspruit, Galpin M114 (K, holo.!; FHO!, P!. PRE!, UPS!).

Found in Mozambique, the Transvaal, Swaziland and Natal (Zululand). Occurs in dry thornveld and bushveld; often forms dense impenetrable thickets.

TRANSVAAL.—2428 (Nylstroom): Mosdene, Naboomspruit, Galpin M114. 2429 (Zebediela): 19 km S. of Olifants River on Chuniespoort to Burgersfort road, Codd 1705. 2528 (Pretoria): Rust der Winter, Gerstner 5526. 2530 (Lydenburg): Schoemanskloof, Pole Evans s.n. 2731 (Louwsburg): 1,6 km N. of Pongola River on road to Gollel, Ross 1706 (NH, NU).

SWAZILAND.—2631 (Mbabane): Mtindekwa, Compton 32059. 2731 (Louwsburg): Ingwavuma Poort, Compton 29793.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, Ward 2020. 2731 (Louwsburg): near entrance to Pongola Poort, Edwards 3260. 2732 (Ubombo): Mkuzi Game Reserve, Ross 1712 (NH, NU). 2831 (Nkandla): Umfolozi Game Reserve, junction of the Gqoyini jeep track and main loop road, Downing 686 (NU). 2832 (Mtubatuba): Hluhluwe, Ward 3933.

Some of the short recurved spines of A. luederitzii var. retinens are invariably greatly enlarged and characteristically swollen. These distinctive swollen spines are often occupied by ants (or sometimes by other insects or small spiders) which gain access through a small aperture near the apex of the spine. There is no evidence that the enlarged spines are caused by the ants and it seems more likely that the occupation by the ants is secondary and that they merely take advantage of the presence of these suitable domatia. The swollen spines develop rapidly and soon become hard, persisting for several years.

Although the distinction between the two varieties of A. luederitzii rests mainly on the enlarged spines (which are not always present), there are other inconstant differential tendencies. Var. luederitzii is often rather taller than var. retinens, usually 4,5–15 m high as opposed to 1–4,5 m high in var. retinens. Var. luederitzii usually has 5–8 pairs of pinnae per leaf, while var. retinens has usually about 2–4 pairs per leaf in the Transvaal, and 5–13 pairs in Swaziland and Natal. The pods in var. luederitzii are 10–19 mm wide, while those of var. retinens do not seem to exceed 15 mm.

A. luederitzii var. luederitzii is very closely related to A. reficiens Wawra, but, although a few specimens from South West Africa are difficult to place, it seems preferable to maintain the two as distinct species. A. reficiens is distinguished by its puberulous or pulverulent indumentum, fewer pinnae pairs and few pairs of leaflets (up to 11(13) pairs per pinna) which are glabrous or almost so on the margins.

A. luederitzii var. retinens is usually readily distinguished from A. reficiens and, as it occupies a different geographical range to A. reficiens, is unlikely to be confused with the latter. However, the main difficulty in this complex is that while var. retinens and A. reficiens are themselves distinct, they are almost linked through typical var. luederitzii.

35. Acacia reficiens Wawra in Sber. Akad. Wiss. Wein 38: 555 (1859); Oliv. in F.T.A. 2: 348 (1871) pro parte quoad specim. Wawra, excl. specim. Welwitsch; Benth. in Trans. Linn. Soc. A. luederitzii Engl. in Bot. Jahrb. 10: 23 (July 1888) pro parte quoad specim. Marloth 1270, excl. lectotypum; Dinter in Feddes Repert. 15: 80 (1917) pro parte quoad specim. Marloth 1270, excl. lectotypum. A. cf. uncinata sensu Torre in C.F.A. 2: 283 (1956), non Engl. A. etbaica sensu Torre in C.F.A. 2: 283 (1956) saltem quoad specim. Gossweiler 9732.

Obconical shrub branching from or near the base or a tree to 6 m high with a flattened or somewhat rounded spreading crown. Bark greyish- or reddish-brown to black. rough, fissured; young branchlets greyishor reddish-brown to purplish, sometimes as though whitewashed over a reddish or purplish background, flaking minutely, shortly puberulous to pulverulent, older branchlets glabrescent. Stipules spinescent, in pairs, all short, strongly hooked, 0,2-0,6 cm long, very occasionally with a few long straight spines up to 7,2 cm long intermixed, coloured like the twigs; "ant-galls" and other prickles absent. Leaves: petiole 0,2-1 cm long, puberulous, adaxial gland often absent; rhachis (0)0,8-2(2,4) cm long puberulous, eglandular or with a small gland at the junction of the top pinna pair; pinnae 1-4 pairs: rhachillae 0,4-1,2 cm long, puberulous; leaflets (5)7-11(13) pairs per pinna, 2-4,5 \times 0,5-1,25 mm, linear to linearoblong, apex rounded to acute, margins glabrous or almost so, sometimes a few appressed marginal cilia present, usually glabrous beneath but occasionally sparingly appressed-pubescent. Inflorescences capitate, on axillary peduncles, usually fascicled, seldom solitary. Flowers yellowish-white, sessile; peduncles 0,6-2,6 cm long, sparingly to densely puberulous; involucel basal or in lower third of peduncle. Calyx puberulous throughout or only apically, tube 1, 1-1,6 mm long, lobes up to 0,6 mm long. Corolla glabrous, tube 1,8-2,8 mm long, lobes up to 1,2 mm long. Stamen-filaments free, up to 6 mm long; anthers with a deciduous apical gland. Ovary up to 1,3 mm long, very shortly stipitate. Pods brown or reddishbrown to purplish, 2,6-8,8 × 0,6-1,1 cm, straight, linear-oblong, longitudinally dehiscent, valves rather thin, brittle, finely longitudinally veined, attenuate basally, obtuse to acuminate apically, ± pulverulent to glabrous or almost so. Seeds olive-brown, 5-7,5 × 3,5-5,5 mm, elliptic to subcircular, usually longitudinal in the pod, smooth, compressed; areole 1.5-4.5 × 1-3 mm.

Found in Angola and South West Africa. Occurs in dry scrub.

S.W.A.—1712 (Posto Velho): Ombepera, De Winter & Leistner 5483. 1813 (Ohopoho): Kaokodavi, Abner 55. 1814 (Otijitundua): Otijitoko, ± 56 km S. of Ohopoho, De Winter & Leistner 5911. 1914 (Kamanjab): Kamanjab, De Winter & Leistner 5911. 1915 (Okaukuejo): Otijitambi Walter 2/92 (M). 2015 (Otijihorongo): Fransfontein, Liebenberg 4920. 2016 (Otjiwarongo): Omatjenne, Keet 1683. 2114 (Uis): Welwitschia plain, south west Brandberg, Giess, Volk & Bleissner 6251. 2115 (Karibib): Karibib, Kinges 3617 (M). 2214 (Swakopmund): 59 km E. of Swakopmund on road to Usakos, De Winter 3199. 2215 (Trekkopje): farm Nudis, Seydel 1679b (K, M); farm Okongava, Seydel 3133 (K). 2216 (Otjimbingwe): farm Auchabis 31, S. of Otjimbingwe, De Winter 2639. 2217 (Windhoek): hills around Windhoek, Keet 1686. Grid ref. unknown: Etosha District (West), S.W. of Etosha Pan, Giess 2048.

Subsp. misera (Vatke) Brenan is recorded from the Sudan, Somali Republic, Uganda and Kenya.

A. reficiens is very closely related to A. luederitzii. For the differences between these two species see the notes under A. luederitzii. A. reficiens subsp. reficiens tends to occupy a somewhat different geographical range to that occupied by A. luederitzii var. luederitzii in South West Africa; the former occurring in the western areas of the territory and the latter in the eastern, although the ranges of the two do show some overlap.

36. Acacia gerrardii Benth. in Trans. Linn. Soc. Lond. 30: 508 (1875); Bak.f., Leg. Trop. Afr. 3: 846 (1930); Brenan in Kew Bull. 12: 369 (1958); in F.T.E.A. Legum. Mimos.: 119 (1959). Type: Natal, locality unknown, Gerrard 1702 (K, holo.!; BM!, TCD!)

var. gerrardii.

Rhod. 85, fig. 18E (1962); Von Breitenbach, Indig. Trees S. Afr. 2: 300 (1965). A. hebecladoides Harms in [Notizbl. Bot. Gart. Berl. 3: 195 (1902) nomen nudum] Bot. Jahrb. 36: 208 (1905); R.E. Fr., Schwed. Rhod.—Kongo-Exped. 1: 63, t.2 fig. 4 (1914); Bak. f., Leg. Trop. Afr. 3: 846 (1930). Type: Tanzania, "Masas Steppe" in the Kilimanjaro region, Merker (B, holo.†).

Tree to 12 m high or less frequently a shrub to 3 m high; trunk to 0,3 m in diam.; crown often flattened, usually irregularly so, branches ascending and spreading somewhat. Bark grey- or reddish-brown to blackish. rough, fissured; young branchlets sparingly to densely grey-pubescent, rarely subglabrous, epidermis usually splitting or flaking to reveal a rusty-red inner layer. Stipules spinescent, in pairs, usually 0,4-1,5 cm long, rarely to 6(12,5) cm long, usually straight or almost so, sometimes slightly recurved, densely pubescent when young but becoming glabrous with age; other prickles absent. Leaves usually borne on distinct "cushions": petiole (0,2)0,7-2(2,5) cm long, adaxial gland usually present on primary leaves but absent from secondary leaves, sometimes absent from both, variable in position, $1-1.7 \times 0.7-1$ mm; rhachis (0.2)2-7(10) cm long, densely pubescent, usually with a gland at the junction of the top 1-2(3) pinnae pairs; pinnae (2)5-10(12) pairs; rhachillae (0,7) 1,5-2,5(3,3) cm long, densely pubescent; leaflets (9)12-23(26) pairs per pinna, (2)3-6(7) \times 0,8-1,3(1,7) mm, linear to linear-oblong. apex rounded to acute, margins with or without spreading cilia, usually glabrous or nearly so beneath, rarely pubescent. Inflorescences capitate, fascicled on axillary peduncles. Flowers white or cream, sessile; peduncles (1,5)2,2-4,5(5,2) cm long, densely grey-pubescent, eglandular or inconspicuously glandular, seldom densely glandular; involuced at or shortly above the base or sometimes to $\frac{1}{3}$ -way up the peduncle. Calyx glabrous apart from pubescence towards the apices of the lobes, tube 0,8,-1,9 mm long, lobes up to 0,5 mm long. Corolla glabrous or very slightly and inconspicuously pubescent, tube 2-3,8 mm long, lobes up to 1 mm long. Stamen-filaments free, up to 9,5 mm long; anthers with a deciduous apical gland. Ovary up to 1,5 mm long, sessile, glabrous at first but soon becoming pubescent. Pods mostly dark brown, densely greypuberulous to -tomentellous, rarely subglabrous, $(4,5)6,5-15,5 \times (0,6)0,8-1,2$ cm, usually falcate, linear or linear-oblong, longitudinally dehiscent, apex acute to acuminate, valves rather thin, brittle. Seeds olivebrown, $9-12 \times 5-7$ mm, \pm quadrate, compressed; areole $5-7,5 \times 3,5-5$ mm.

Widespread in tropical Africa from Nigeria in the west to the Sudan in the north-east and southwards to Botswana, the Transvaal, Swaziland and Natal. Occurs in dry river valley scrub, dry thornveld, bushveld and woodland.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, 4 km E. of Punda Milia, Codd 4241. 2329 (Pietersburg): near Mara, Schlieben & Strey 8288. 2330 (Tzaneen): 13 km N.W. of Duiwelskloof on road to Soekmekaar, De Winter 7729. 2428 (Nylstroom): Mosdene, Naboomspruit, Galpin 474M. 2429 (Zebediela): 3, 2 km beyond Chuniespoort Hotel, Obermeyer & Verdoorn 9. 2431 (Acornhock): near Klaserie, Strey 7936. 2529 (Witbank): hills on N. side of Loskop Dam, Mogg 17309. 2530 (Lydenburg): Lowveld Botanic Garden, Nelspruit, Buitendag 717. 2531 (Komatipoort): Barberton, Pott 5303.

SWAZILAND.—2631 (Mbabane): Umtintegwa, Stegi-Sipofaneni road, *Compton 28028*. 2731 (Louwsburg): near Gollel, *Compton 29095*.

NATAL.—2632 (Bela Vista): Ndumu, Ross 1265 (NH, NU). 2731 (Louwsburg): 17,6 km from Nongoma on Magudu road, Ross 1079 (NH, NU). 2732 (Ubombo): eastern foothills of Lebombo Mountains, Strey 6576. 2831 (Nkandla): Umfolozi Game Reserve, road from Tobothi to Ngoloti, Ross 2016. 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 1908. 2930 (Pietermaritzburg): Bisley, near Pietermaritzburg, Ross 1684 (K, NH, NU). 2931 (Stanger): 4,8 km S. of Mandini on old main road, Ross 868 (NH, NU). 3030 (Port Shepstone): Campbellton, Rudatis 2053 (NH).

A. gerrardii is a variable species but within our area only one variant occurs, namely, var. gerrardii. To be precise, our plants should be referred to as subsp. gerrardii var. gerrardii as Zohary in Israel J. Bot. 13: 39 (1964) described subsp. negevensis from the Negev Desert in Israel.

Although fairly widespread in our area, var. gerrardii is seldom dominant to the exclusion of all other Acacia species except very locally.

In Sekukuniland in the eastern Transvaal, specimens of *A. karroo* with densely pubescent young branchlets, leaf-rhachides, leaflets and pods occur which, superficially, bear a strong resemblance to specimens of *A. gerrardii*. However, these specimens are readily distinguished from *A. gerrardii* as they have bright yellow flowers, elliptic seeds, and lack the large cushion-like abbreviated shoots from which the leaves arise.

Afr. 2: 307 (1965); De Winter et al, 66 Transv. Trees 54 (1966); Brenan in F.Z. 3,1: 103 (1970); Palmer & Pitman, Trees S. Afr. 2:807 (1973). Type: Cape Province, Kuruman Distr, Takoon [Litakun], Burchell 2265 (K, holo.!)

Tree to 20 m high, crown irregularly rounded or flattened and spreading, branches usually ascending. Bark grey to dark brown or blackish, usually rough and fissured; young branchlets robust, grey to greyish- or reddishbrown to purplish-black, lenticellate, glabrous to pubescent, smooth, not flaking off to reveal a rusty-red inner layer, eglandular. Stipules spinescent, mostly short and up to 1,2 cm long, sometimes longer, to 7(12,5) cm long, straight or slightly curved, whitish but becoming greyish with age; "ant-galls" and other prickles absent. Leaves usually borne on distinct "cushions": petiole (0,3)0,7-2,1(3,1)cm long, eglandular or with an oval gland up to 1.5×1.2 mm a short distance below the lowest pinna pair, glabrous to puberulous; rhachis (0)2,2-5,1(7,4) cm long, glabrous to pubescent, a small gland at the junction of the top 2 or the lowest pinna pair, sometimes between each pair when few pinnae are present; pinnae (1)3-5(7) pairs; rhachillae (1,2)2-5,6(7,4) cm long, glabrous to pubescent; leaflets (6)10-22(27) pairs per pinna, $(2,5)3,5-7,5(17) \times 1-3,6(8,5)$ mm, linearor obovate-oblong, apex obtuse or rounded, glabrous or occasionally sparingly puberulous beneath, margins glabrous or with

conspicuous or inconspicuous cilia. Inflorescences capitate, on axillary peduncles, usually fascicled, seldom solitary. Flowers white, sessile; peduncles 1,2-5,4 cm long, glabrous to shortly pubescent or puberulous, eglandular or inconspicuously glandular; involucel from near the base to just over 3 way up the peduncle. Calyx glabrous or apices of lobes sometimes sparingly pubescent, tube 1,2-2,8 mm long, lobes 0,3-0,6 mm long. Corolla glabrous, tube 2,6-3,4 mm long, lobes 0.4-0.8 mm long. Stamen-filaments free, up to 7 mm long; anthers with a deciduous apical gland. Ovary 0,7-1,8 mm long, glabrous, sessile. Pods brown to dark reddishbrown or sometimes blackish, (2,4)6-15(22) \times (0,9)1,2-3,1 cm, linear, straight to falcate, apex rounded to acute, longitudinally dehiscent, valves thinly woody, brittle, smooth, ± longitudinally veined, glabrous, attenuate basally. Seeds dark olive- to reddish-brown, 7,5-12 \times 5-9 mm, quadrate to subcircular-lenticular, smooth, compressed; areole $5,5-9 \times 3,5-6$ mm.

Found in Kenya, Tanzania and southwards to South West Africa (Caprivi Strip), Botswana, the Transvaal, Swaziland, Natal and the Cape Province. Three subspecies are recognized within A. robusta, two of which occur in our area.

Leaf-rhachis sparingly to densely pubescent; peduncles sparingly to densely pubescent; pods usually±falcate, 1,2-1,7 cm wide(b) subsp. clavigera

(a) subsp. robusta.

Brenan in F.Z. 3,1: 103 (1970); Ross, Acacia Spp. Natal 37, fig. 2/21 (1971); Fl. Natal 193 (1973).

A. robusta Burch., Trav. 2: 442 (1824).

Leaf-rhachides glabrous or almost so; pinnae mostly 2-5 pairs; leaflets 10-15 pairs per pinna, (2)2,5-7 mm wide. Peduncles and calyx-lobes glabrous or almost so. Pods straight or slightly curved, (1,3)1,7-3,1 cm wide.

Found in Rhodesia, Botswana, the Transvaal, Natal and the Cape. Occurs on wooded slopes, in woodland, thornveld and river valley scrub in the interior regions of southern Africa.

The distinction between subsp. robusta and subsp. clavigera (E. Mey.) Brenan in Natal and, to a lesser extent, in the eastern Cape is sometimes not particularly clear and intermediates and mixed populations, showing various combinations of characters, occur. Consequently, in these areas difficulty is sometimes experienced in referring specimens to either subspecies with certainty.

Subsp. robusta typically has glabrous or subglabrous leaf-rhachides and peduncles, while the pods are usually straight or only slightly curved and 1,7-3,1 cm wide. However, some specimens, for example, Ross 984 from the Umgeni valley near Camperdown in Natal, with large leaflets, wide pods and the general facies of subsp. robusta, have quite densely pubescent leaf-rhachides as in subsp. clavigera. Other intermediate specimens have pubescent leafrhachides and small leaflets as in subsp. clavigera but pods up to 2 cm wide as in subsp. robusta. Leaflets in subsp. robusta tend to be larger than in subsp. clavigera but there is complete overlap in leaflet size between the two subspecies. Similarly, there is overlap in pod width. Despite the presence of some intermediates, most specimens in our area can be readily placed either in subsp. robusta or in subsp. clavigera.

In Natal subsp. *robusta* occurs in the dry interior areas whereas subsp. *clavigera* is mainly coastal in distribution.

(b) subsp. clavigera (E. Mey.) Brenan in F.Z. 3,1: 104 (1970); Ross, Acacia Spp. Natal 37, fig. 2/20 (1971); Van Wyk, Trees Kruger Nat. Park 1: 156 (1972); Ross, Fl. Natal 193 (1973). Type: Natal, near Durban [Port Natal], Drege (K, iso.!, P, fragm.!)

The Zulu name for subsp. clavigera is "umNga-manzi" which means "fond of water".

Subsp. *usambarensis* (Taub.) Brenan has not been recorded so far in our area.

38. Acacia grandicornuta Gerstn. in J.S. Afr. Bot. 4:55, fig. 1 (1938); O.B. Miller, Checklist Bech. Prot. 19 (1948); Codd, Trees & Shrubs Kruger Nat. Park 44, fig.

38c, d, e (1951); O.B. Miller in J.S. Afr. Bot. 18: 21 (1952); Brenan in F.Z. 3,1: 104 (1970); Ross, Acacia Spp. Natal 29, fig. 2/19 (1971); Van Wyk, Trees Kruger Nat. Park 1: 140 (1972); Ross, Fl. Natal 193 (1973); Palmer & Pitman, Trees S. Afr. 2: 805 (1973). Syntypes: Natal, flowered at Emkunzana and Mkuzi Drift between Nongoma and Magudu, 6 Jan. 1936, Gerstner 2870 (BOL!); fruits found at same places and at lower Pongola, 13 May 1936, Gerstner 2870 (BOL!).

A. clavigera E. Mey. subsp. clavigera pro parte quoad syn. A. grandicornuta sensu Von Breitenbach, Indig. Trees S. Afr. 2: 302 (1965).

Tree to 12 m high, crown + rounded, often irregularly so, branches usually ascending. Bark grey to brownish-black or black, rough, longitudinally fissured; young branchlets greyish to reddish-brown or purplish, lenticellate, glabrous, smooth, not flaking off to reveal a rusty-red inner layer. Stipules spinescent, in pairs, 0,2-10(14) cm long, straight or slightly curved, sometimes deflexed, typically stout and slightly swollen, whitish but becoming greyish with age; other prickles absent. Leaves: petiole 0,4-2 cm long, glabrous, eglandular or with a rounded to elliptic gland up to $1,5 \times 1$ mm, variable in position; rhachis 0-3,6 cm long, glabrous or subglabrous, a small gland at the junction of the top or top 1-3 pinnae pairs; pinnae (1)2-3(5) pairs; rhachillae 0,9-3,6(5,2) cm long, glabrous; leaflets 7-18 pairs per pinna, $3-8 \times (1)1, 5-2, 5(3,2)$ mm, linear to linearor obovate-oblong, apex obtuse or rounded, glabrous throughout or rarely margins minutely ciliate, lateral nerves invisible or slightly conspicuous beneath. Inflorescences capitate, on axillary peduncles, fascicled. Flowers white, sessile; peduncles 1,2-2,5 cm long, glabrous or occasionally very sparingly puberulous, eglandular; involucel $\frac{1}{3}$ — $\frac{1}{2}$ —way up the peduncle. Calyx glabrous throughout or apices of lobes occasionally with a few hairs, tube 0,8-1,3 mm long, lobes up to 0,3 mm long. Corolla glabrous, tube 1,6-2,2 mm long, lobes up to 0,6 mm long. Stamenfilaments free, up to 5 mm long; anthers with a deciduous apical gland. Ovary up to 1 mm long, glabrous, very shortly stipitate. Pods brown to reddish-brown or $(4,8)6-12,8(15,2) \times 0,6-1,1$ cm, falcate or occasionally straightish, sometimes irregularly constricted between some of the seeds, longitudinally dehiscent, valves rather thin, brittle, finely longitudinally veined, glabrous, attenuate basally. *Seeds* olive-brown, $6-10 \times 5-7$ mm, \pm oblong, smooth, compressed; areole $4-6 \times 2, 5, 4-5$ mm.

Found in south-eastern Botswana, Rhodesia, Mozambique, the Transvaal, Swaziland and Zululand. Occurs in dry thornveld and woodland; favours deep soils. Sometimes dominant over fairly large areas and forming thickets.

TRANSVAAL.—2230 (Messina): Gaandrik area, Van der Schijff 5261. 2328 (Baltimore): near Villa Nora, Acocks 8817. 2426 (Mochudi): 4 km S.W. of Rooibokkraal, Codd 8654. 2429 (Zebediela): 19,2 km S. of Olifants River on Chuniespoort to Burgersfort road, Codd 1706. 2430 (Pilgrim's Rest): 20,8 km S. of Steelpoort, Morris 1184. 2431 (Acomhoek): Kruger National Park, 4,8 km E. of Skukuza, Codd & Verdoorn 5493. 2531 (Komatipoort): Kruger National Park, 4,8 km from Skukuza on Crocodile Bridge road, Story 3940. 2731 (Louwsburg): 3,2 km N. of Pongola River on road to Gollel, Ross 1707 (NH, NU).

A. grandicornuta is closely related to A. robusta Burch. in its wide sense and a case could perhaps be made out for placing it under the latter species. However, A. grandicornuta is a very distinctive taxon and it seems best maintained as a distinct species.

The more slender branches and the narrow falcate pods distinguish *A. grandicornuta* from *A. robusta* subsp. *robusta*, while the glabrous leaf-rhachides typically fewer pinnae and leaflets, and the narrow pods distinguish *A. grandicornuta* from *A. robusta* subsp. *clavigera*.

A. hermannii Bak.f. in J. Bot., Lond. 67: 198 (1929); Bak.f., Leg. Trop. Afr. 3: 847 (1930); Brenan, Checklist Tang. Terr. 337 (1949); Wild, S. Rhod. Bot. Dict. 47 (1953). Type: Tanzania, Singida District, near Manyugi [? Manyigi], B.D. Burtt 1379 (BM, holo.!; FHO!, K!, Z!). A. rufobrunnea N.E. Br. in Kew Bull. 1909: 107 (1909). Type: Botswana, Ngamiland, Botletle valley, E.J. Lugard 245 (K, holo.!). A. seyal Del. var. multijuga sensu O.B. Miller in J. S. Afr. Bot. 18: 24 (1952) quoad specim. Pole Evans 3251, non Schweinf.

Shrub or small tree 1,5-9 m high, branching from near the base. Bark pale to dark grey- or reddish-brown to black, rough; young branchlets pale to dark grey- or reddish-brown, often as though whitewashed over a purplish background, sparingly to densely puberulous. Stipules spinescent, in pairs, up to 6 cm long, straight, slender, usually the same colour as the young branchlets and sparingly to densely puberulous; other prickles absent. Leaves: petiole 0, 3-1, 4 cm long, adaxial gland often absent, when present usually just below the lowest pinna pair, slightly raised, round to oval, $0,6-1,4 \times$ 0,5-1,2 mm; rhachis 5-21,5 cm long, sparingly to densely pubescent, with a gland at the junction of each of the top 1-3 pairs of pinnae: well-developed leaves with 15-36 pairs of pinnae (reduced leaves with as few as 9 pairs of pinnae sometimes also present); rhachillae 1,2-4,1 cm long; leaflets (11)18-26(32) pairs per pinna, 1,5-5 \times 0,5-1,1 mm, linear to linear-oblong, apex rounded to subacute, margins glabrous or ciliate, glabrous abaxially. Inflorescences capitate, solitary or more usually fascicled, often crowded into an irregular terminal "raceme". Flowers white or pale pink, sessile; peduncles (0,6)1,1-2,2(2,9) cm long, sparingly to densely pubescent, usually glandular; involucel at or above the middle or at the apex of the peduncle. Calyx cupular, white or pink, sparingly to densely pubescent, especially at apices of lobes, tube 0,3-0,9 mm long, lobes up to 0,6 mm long. Corolla tubular, glabrous, tube up to 2,5 mm long, lobes up to 0,7 mm long, usually 2-4 times as long as the calyx. Stamen-filaments free, up to 5 mm long; anthers 0,2-0,25 mm across, with a deciduous apical gland. Ovary up to 1 mm long, glabrous. Pods pale to dark reddish-brown, $8-22 \times 0.5-0.8$ cm, arcuate, sometimes slightly constricted between the seeds, flat, longitudinally dehiscent; valves thin, glabrous to sparingly pubescent and glandular. Seeds olive-grey, $7-9 \times 3-4$, 5 mm, oblong or quadrate, smooth, compressed; areole $3,5-4,5 \times 1,5-2,25$ mm.

Occurs in Tanzania, Angola, South West Africa, Botswana and Rhodesia. Found usually in drier types of mixed woodland, grassland or scrub, sometimes with *Colophospermum mopane*.

S.W.A.—1715 (Ondangua): Okapsa, road dam near Ondangua, De Winter & Giess 6898. 1721 (Mbambi): between Shamvura and Kangongo, De Winter 4209. 1813 (Ohopoho): 32 km S. of Kaoko Otavi on road to Ombombo, De Winter & Leistner 5609. 1821 (Andara): road from Andara to Bagani, Merxmuller & Giess 1992. 1824 (Kachikau): E. Caprivi Strip, 62 km from Katima Mulilo on road to Linyanti, Killick & Leistner 3127.

A. davyi bears a superficial resemblance to A. arenaria. For the differences between the two species see the notes under A. davyi.

40. Acacia rehmanniana Schinz in Bull. Herb. Boiss. 6: 525 (1898); Burtt Davy in Kew Bull. 1908: 159 (1908); Glover in Ann. Bolus Herb. 1: 151 (1915); Eyles in Trans. Roy. Soc. S. Afr. 5: 362 (1916); Bak.f., Leg. Trop. Afr. 3: 838 (1930); Burtt Davy, Fl. Transv. 2: 343 (1932); O.B. Miller, Checklist Bech. Prot. 20 (1948); in J.S. Afr. Bot. 18: 24 (1952); Pardy in Rhod. Agric. J. 51: 376 (1954); F. White, For. Fl. N. Rhod. 86, fig. 18i (1962); Von Breitenbach, Indig. Trees S. Afr. 2: 304 (1965); Brenan in F.Z. 3,1: 99 (1970); Palmer & Pitman, Trees S. Afr. 2: 783 (1973). Type: Transvaal, Streydpoort, Makapansberge, Rehmann 5517 (Z, holo.!).

Shrub or tree to 10 m high with a somewhat flattened spreading crown. Bark reddish-brown to black, rough; young branchlets clothed with dense spreading hairs, the hairs golden at first but turning greyish-white, sometimes becoming glabrescent with age, the epidermis later peeling or flaking off to reveal a rusty-red inner layer. Stipules spinescent, in pairs, 0,5-5,4 cm long, straight or almost so, sparingly to densely pubescent with spreading hairs especially basally, becoming glabrescent with age; other prickles absent. Leaves densely clothed with spreading hairs, at first golden but turning greyishwhite, sometimes becoming glabrescent: petiole 0,1-0,5 mm long, adaxial gland present, yellowish to reddish-brown, oval, somewhat flattened, up to $1,5(3) \times 1(2)$ mm; rhachis 2,4-12 cm long, a small gland usually at the junction of the top 1-3 and bottom 1-6 pinnae pairs, sometimes present between each pinna pair or absent from some; well-developed leaves of mature shoots with 15-44 pinnae pairs (reduced leaves with as few as 8 pinnae pairs are sometimes

also present); rhachillae 0,6-2,8 cm long; leaflets 24-48 pairs per pinna, 1,2-2,8 × 0,4-0,9 mm, linear to linear-oblong, apex rounded to acute, margins with conspicuous spreading hairs especially apically. Inflorescences capitate, on axillary peduncles, solitary or more usually fascicled, aggregated into a terminal "raceme", each fascicle of heads subtended by young to scarcely developed leaves. Flowers white or cream, sessile; peduncles 0.5-2 cm long, clothed with dense spreading hairs, the hairs golden at first but soon turning grevish-white, eglandular; involucel below the middle of the peduncle. Calyx sparingly to densely pubescent towards the apices of the lobes, sometimes a small basal tuft of hairs also present, tube 1,6-2,2 mm long, lobes up to 0.7 mm long, Corolla glabrous apart from the sparingly to densely pubescent lobes, tube 2-2,8 mm long, lobes up to 1,2 mm long. Stamen-filaments free, up to 7 mm long; anthers with a deciduous apical gland. Ovary up to 1,6 mm long, sessile, sparingly to densely pubescent. Pods grey- or reddish-brown to olive, (2,9) $7-10(14) \times 1, 1-1, 8(2,2)$ cm, linear-oblong, straight or almost so, longitudinally dehiscent, flattened, not constricted between the seeds, slightly venose, glabrous to sparingly pubescent. Seeds olive- or reddish-brown, $4.5-8 \times 4-7$ mm, ellipsoid to suborbicular, scarcely compressed; are ole $2,5-4,5 \times$ 1,25-2,8 mm, completely closed.

Found in southern Zambia, northern Botswana, Rhodesia and the Transvaal. Occurs in wooded grassland and bushveld; sometimes near rivers or streams.

TRANSVAAL.—2329 (Pietersburg): Mara, Rogers 21706. 2330 (Tzaneen): Duiwelskloof, Schweickerdt 1556. 2429 (Zebediela): 32 km S. of Pietersburg on road to Chuniespoort, Van Vuuren 1603.

A. rehmanniana has been often confused with A. sieberana DC. in the past. However, A. rehmanniana is a distinctive species, easily separated from A. sieberana by the more numerous pairs of closely arranged pinnae, the much smaller and thinner textured pods, the involucels in the lower half of the peduncle, and the way in which the capitula are clustered in the axils and aggregated into terminal "racemes".

A. rehnianniana was reported to occur in Natal in F.Z. 3,1:100 (1970), but this record was probably based on a very poor specimen (Sidey 3574) of A. sieberana DC. var. woodii (Burtt Davy) Keay & Brenan.

41. Acacia sieberana DC., Prodr. 2: 463 (1825); Oliv. in F.T.A. 2: 347 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 503 (1875);

Type as for A. vermoesenii A. cf. stolonifera sensu Torre in C.F.A. 2: 282 (1956)) quoad specim.

Gossweiler 11035 (K) pro parte, non Burch. A. sieberana subsp. vermoesenii (De Wild.) Troupin var. vermoesenii, Troupin in Bull. Jard. Bot. Brux. 35: 455 (1965); Schreiber in F.S.W.A. 58: 12 (1967). Type as for A. vermoesenii. A. sieberana subsp. vermoesenii var. woodii (Burtt Davy) Keay & Brenan, Troupin in Bull. Jard. Bot. Brux. 35: 457 (1965). Type as for A. woodii.

Tree to 18 m high, branches usually spreading, crown typically flattened and spreading or umbrella-shaped, sometimes branches ascending and crown conical, particularly in young plants. Bark yellowishor greyish-brown, rough, typically papery, the outer layers flaking off to expose a yellowish inner layer, sometimes + smooth and not flaking; young branchlets vellowishor greyish-brown, smooth or the outer bark flaking away to reveal a yellowish inner layer, glabrous to densely tomentose, indumentum golden to greyish-white. Stipules spinescent, in pairs, 0,3-7,8 cm long, straight or almost so, whitish, glabrous to densely tomentose; other prickles absent. Leaves glabrous to densely tomentose, indumentum golden to grevish-white: petiole 0.2-1 cm long, adaxial gland present, often just below the lowest pinna pair, yellowish to reddish-brown, up to 2×1.5 mm; rhachis 2.5-12.8 cm long, a small gland present at the junction of the top 1-6 pinnae pairs only, between each pair, or absent from some; pinnae (4)8-30 pairs; rhachillae 0,8-4(6,5) cm long; leaflets 13-45 pairs per pinna, $1,2-6,5 \times 0,5-$ 1,6 mm, linear to linear-oblong, apex rounded to acute, margins with or without cilia, usually glabrous beneath, midrib and sometimes a few lateral nerves often fairly prominent beneath. Inflorescences capitate, on axillary peduncles, solitary or fascicled. Flowers pale yellowish-white, sessile or very shortly pedicelled; peduncles 1,4-5,8 cm long, glabrous to densely tomentose, indumentum golden to greyish-white, eglandular; involuced apical or in the upper half of the peduncle. Calyx sparingly pubescent throughout or glabrous except for pubescence towards the apices of the lobes, tube 1,6-2,4 mm long, lobes up to 0,8 mm long. Corolla glabrous throughout or apices of lobes sparingly pubescent, tube 2,4-3,6 mm long, lobes up to 2 mm long. Stamen-filaments free, up to 9 mm long; anthers with a deciduous apical gland. Ovary sessile, up to 2,1 mm long, glabrous. Pods pale to dark yellowish- or reddish-brown, 5-19,5 \times

1,3-3,3 cm, straight or slightly curved but sometimes \pm falcate, somewhat flattened or at times oval in cross-section, thick and almost woody in texture when dry, tardily dehiscent, often only dehiscing on the ground, smooth, glossy and glabrous or subglabrous to densely pubescent especially on margins and stipe, indumentum frequently golden. Seeds olive to grey-brown, $7-12 \times 5-8$ mm, elliptic to subcircular, slightly compressed, smooth; areole $5-9.5 \times 4-6$ mm.

Found from the Sudan and Ethiopia southwards to South West Africa, Botswana, the Transvaal, Swaziland and Natal. Occurs in grassland, savanna, woodland and thornveld; favours deep soils or shallow soil overlying shale.

S.W.A.—1714 (Ruacana Falls): 20,8 km W. of Ruacana at the Kunene River, Giess & Wiss 3346. 1718 (Kuring-Kuru): 9,6 km E. of Tondoro mission on road to Lupala, De Winter 3965.

The indumentum on the young branchlets, leaves, peduncles and pods in typical var. woodii is villous and distinctly golden, especially when young. However, there is considerable variation in the degree of pubescence and in the colour of the indumentum. The young branchlets vary from glabrous or subglabrous to densely pubescent, while the indumentum varies in colour from golden to greyish-white. Often in amongst the greyish-white indumentum a faint tinge of gold is visible, especially at the

base of the petioles, spincs and peduncles. Occasionally the indumentum on the old shoots is greyish-white while on young branchlets from the same plant the indumentum is golden.

Var. woodii typically has yellowish-brown papery bark that flakes off irregularly, whence the common names "Paperbark Thorn" and "Papierbasdoring". Often, however, the bark does not flake or peel off at all. Both forms frequently occur in the same population. There seems to be a tendency for specimens with non-peeling bark to have glabrous or glabrescent branchlets and in Natal these plants are often, but by no means always, confined to the coastal areas. These plants sometimes seem to occupy slightly different ecological conditions to those occupied by the densely pubescent specimens with papery peeling bark. However, these ± glabrous specimens seem best regarded as ± glabrous forms of var. woodii since they are otherwise indistinguishable from specimens of var. woodii.

The typical forms of var. woodii and var. vermoesenii appear to be different but as they are linked by so many and varied intermediates, and as difficulty is frequently experienced in attempting to refer specimens to one variety or the other with certainty, it is no longer considered desirable to maintain both of these varieties. Consequently, var. vermoesenii has been relegated to synonymy under var. woodii.

The pods of A. sieberana, which dehisce very slowly and usually only after they have been shed from the plant, are eaten by livestock and by game and are reputed to cause tainting of dairy produce when eaten in quantity. The leaves contain large amounts of prussic acid particularly when wilted and have caused some stock losses.

In common with some other *Acacia* species, a few flowers sometimes develop in the involucel on the peduncle, giving the appearance of a smaller secondary capitulum below the main one.

A. sieberana has in the past been confused with A. rehmanniana Schinz. The differences between the two species are given under A. rehmanniana.

42. Acacia hebeclada DC., Cat. Hort. Monsp. 73 (1813); Prodr. 2: 461 (1825); Brenan in F.Z. 3,1: 109 (1970); Palmer & Pitman, Trees S. Afr. 2: 775 (1973). Type: Cape Province, Kuruman Distr., between Kuruman [New Litakun] and the Matlowing [Moshowing] River, Burchell 2267 (G, holo.; K!, PRE!).

Low spreading shrub or tree 0,4–9 m high, shrubs branching near ground-level or with aerial stems arising from a subterranean stolon, often forming large dense thickets; crown in arborescent forms rounded with the branches sometimes drooping to the ground or flattened and spreading somewhat. Bark dark grey- or reddish-brown to blackish, fissured; young branchlets pale to dark grey- or reddish-brown to purplish, sometimes appearing as though whitewashed over a

purplish background, sparingly to densely grey-pubescent or tomentose, sometimes becoming glabrescent with age, epidermis sometimes splitting and flaking minutely. Stipules spinescent, in pairs, straight to arcuate or hooked, either short and 0,4-+ 1.5 cm long or up to 6 cm long and then straight or very slightly recurved apically, greyish-white to reddish, pubescent when young but becoming subglabrous or glabrous; "ant-galls" and other prickles absent. Leaves: petiole 0, 3-0, 9(1,9) cm long, densely spreading-pubescent, adaxial gland present or absent, rounded or elongated along the petiole, up to 2×1.6 mm, often just below lowest pinna pair; rhachis (0)1-4,5(6) cm long, sparingly to densely spreading-pubescent, often with minute scattered glands, a small gland often at the junction of the top 1-3 pinnae pairs and sometimes the lowest pair; pinnae (1)4-9(12) pairs; rhachillae (0,4)1,2-2(3,4) cm long, sparingly to densely spreading-pubescent; leaflets 7-18 pairs per pinna, $(1,5)2,5-5(7) \times (0,75)0,9-1,5(2)$ mm, linear to linear- or obovate-oblong, apex rounded to subacute, margins usually with spreading cilia, sometimes cilia inconspicuous or absent, usually glabrous beneath but sometimes sparingly appressed pubescent. Inflorescences capitate, on axillary peduncles, usually fascicled and scattered along the shoots, seldom solitary. Flowers yellowish-white or cream, sessile; peduncles 0,5-2(4) cm long, sparingly to densely spreading-pubescent, hairs on peduncle often equalling or longer than its diameter, usually eglandular, becoming glabrescent and thick and \pm woody with age; involuced at or shortly above the base or occasionally to almost halfway up the peduncle. Calyx glabrous except for the apices of the lobes which are sparingly to densely pubescent, tube 1,2-1,8 mm long, lobes 0,5-0,8 mm long. Corolla glabrous throughout or apices of lobes sparingly to densely pubescent, tube 2,5-3,2 mm long, lobes 0,2-0,6 mm long. Stamen-filaments free, up to 6,5 mm long; anthers with a deciduous apical gland. Ovary up to 1,6 mm long, shortly stipitate, glabrous. Pods yellowish- to greyish-brown, $4-21 \times 1-4,5$ cm, up to 1,5 cm thick, straight or nearly so, seldom ± falcate, turgid, oblong-ellipsoid, cylindric or fusiform, apex rounded to acute or distinctly pointed, erect or pendulous, finally longitudinally dehiscent; valves thick, hard, densely tomentellous outside, longitudinally nerved, sometimes very conspicuously so, sparingly to densely glandular. Seeds olives to reddish-brown, on a long funicle, 6-15 × 4-11 mm, subcircular-lenticular, sometimes scarcely compressed; areole 5-12 × 2-7 mm.

Found in Angola, South West Africa, Botswana, western Zambia, western Rhodesia, the Transvaal, western Orange Free State and northern Cape Province.

Pods erect, $4-12(14,5) \times 1,5-4,5$ cm, straight or nearly so:

Pods (1)1,5-2,3(2,5) cm wide, seed 7-9 × 5,5-7 mm; flowering peduncles mostly 0,5-1,5 cm long; low spreading shrub or tree, often gregarious; widespread in arid areas in South West Africa, the Transvaal, Orange Free State and the northern Cape.....(a) subsp. hebeclada

Pods 2,5-3,5(4,5) cm wide; seed 10-15 × 7-10,5 mm; flowering peduncles mostly 1,5-3 cm long, large riverine shrub or a tree occuring in north-east South West Africa (Caprivi Strip). (b) subsp. chobiensis

Pods pendulous (at least when mature), 10-21 × 1-1,5 cm, often somewhat falcate; tree or large shrub occurring in northern South West Africa.....(c) subsp. tristis

(a) subsp. hebeclada.

Grid ref. unknown: Vryburg district, along Molopo River, De Winter 7832.

A. hebeclada subsp. hebeclada occurs either as a low spreading shrub branching near ground level or with stems arising from a subterranean stolon, or as a tree. Plants often form large dense impenetrable thickets several metres in diameter. In the Kalahari these thickets are frequently utilized by the large carnivores for shelter during the heat of the day.

Specimens of subsp. hebeclada are usually readily distinguished from subsp. chobiensis which just reaches our area. However, some specimens, but not from our area, are difficult to place. In addition to the smaller pods, subsp. hebeclada tends to have shorter internodes \pm 1-1,5 cm long, smaller leaves

and shorter peduncles. Subsp. hebeclada has a different distributional range and different ecological preferences to subsp. chobiensis.

A. hebeclada subsp. hebeclada when in pod cannot be mistaken. Flowering specimens, however, particularly those with inadequate habit notes, can be confused with A. luederitzii Engl. The pods in subsp. hebeclada often persist on the plant for more than one season so that it is possible to find flowers and the previous season's pods on a plant together. The flowers are sometimes produced when the plants are leafless.

(b) subsp. chobiensis (O.B. Miller) Schreiber in Mitt. Bot. Staatssamml. Munchen 6: 251 (1966); in F.S.W.A. 58: 9 (1967). Type: Botswana, Serondella, O.B. Miller B/1069 (K, holo.!).

A. stolonifera Burch. var. chobiensis O.B. Miller in J. S. Afr. Bot. 18: 25 (1952). Type as above. A. hebeclada sensu F. White, For. Fl. N. Rhod. 85, fig. 18A (1962); Brenan in F.Z. 3,1: 109 (1970) proparte

Found in north-eastern South West Africa (Caprivi Strip), northern Botswana, western Rhodesia and Zambia. Occurs on alluvial soils along river banks, often partially submerged.

S.W.A.—1719 (Runtu): Okavango River at Runtu, De Winter & Marias 4915. 1724 (Katima Mulilo): Lisikili, 24 km E. of Katima Mulilo, Codd 7091. 1821 (Andara): Andara, Merxmuller & Giess 1946.

Subspecies *chobiensis* occurs as a tree or large shrub. The growth form is often hemi-spherical, the lower branches touching the ground.

(c) subsp. tristis Schreiber in Mitt. Bot. Staatssamml. Munchen 6: 251 (1966); in F.S.W.A. 58: 9 (1967); Ross in Bothalia 11: 131 (1973); Schreiber in Mitt. Bot. Staatssamml. Munchen 11: 117 (1973). Type: Angola, Huila district, between Lopolo e Ferrão da Sola, Welwitsch 1829 (LISU, holo.; BM!, K!).

A. tristis Welw. ex Oliv. in F.T.A. 2: 349 (1871) nom. illegit, non A. tristis R. Graham in Bot. Mag. 62: t.3420 (1835); Benth. in Trans. Linn. Soc. Lond. 30: 510 (1875); Bak.f., Leg. Trop. Afr. 3: 838 (1930) pro parte excl. specim. Munro 453; Torre in C.F.A. 2: 282 (1956). Type as above. A. hebeclada sensu Harms in Warb., Kunene Samb. Exped. 243 (1903).

Found in southern Angola and in northern South West Africa. Occurs in open bush, mixed woodland and thornveld; usually on sandy soils.

S.W.A.—1715 (Ondangua): 24 km W. of Ndola Store on road to Ombalantu, De Winter 3632; Oshikango, De Winter & Giess 7055. 1718 (Kuring-Kuru); Makambu Camp, 32,8 km W. of Kuring-Kuru on road to Katwitwi, De Winter & Marais 5015. 1813 (Ohopoho): near Ohopoho, De Winter & Leistner 5305; 8 km N. of Ombombo, De Winter & Leistner 5887.

Subspecies *tristis* grows as a tree with a rounded or flattened and somewhat spreading crown, or as a shrub. The narrow pendulous pods readily distinguish subsp. *tristis* from subsp. *hebeclada* and subsp. *chobiensis*.

Legum.-Mimos.: 131, figs. 17/61, 19 (1959); in F.Z. 3,1: 110, t.16/20 (1970). Syntypes: Tanzania: Dar es Salaam, Stuhlmann 6755 (B, †); Pangani, Stuhlmann 282 (B, †); Tanga, Volkens 189 (B, †); Amboni, Holst 2202 (K!, Z!); Tanzania/Kenya, Lake Jipe, Vol-

kens 2383 (B, †).

Obconical shrub to 2,5 m high, branching from the base. Bark olive- to dark reddish-brown; young shoots with spreading golden villous hairs 1,5-3 mm long, hairs later going greyish-white; branchlets oliveto reddish-brown, longitudinally wrinkled, with large yellowish somewhat transversely elongated lenticels, becoming glabrescent with age. Stipules spinescent, in pairs, 0,7-6,5 cm long, straight or slightly deflexed, sparingly to densely pubescent especially basally, becoming glabrescent with age; "ant-galls" and other prickles absent. Leaves sparingly to densely clothed with spreading whitish hairs: petiole 0,3-1 cm long, adaxial gland usually present on primary leaves but absent from secondary leaves; rhachis 2-5,5(7,5) cm long, a gland often at the junction of the top 1-3 pinnae pairs or absent; pinnae 4-12 pairs (occasionally leaves on juvenile non-flowering shoots may have up to 17 pairs of pinnae and rhachides up to 9 cm long); rhachillae 1,1-1,9 cm long; leaflets 6-15 pairs per pinna, 2-5,5 \times 0,6-1,5 mm, linear-oblong, apex subacute to acute, glabrous beneath, margins usually with appressed or spreading cilia. Inflorescences capitate, on axillary peduncles, fascicled or solitary, usually produced before the leaves. Flowers white, sessile; peduncles 0.6-1.6 cm long, densely hairy or tomentose, eglandular; involucel basal or in lower half of the peduncle, up to 3 mm long. Calvx sparingly to densely pubescent apically, tube 1,6-2,2 mm long, lobes up to 0,4 mm long. Corolla sparingly to densely pubescent apically, tube 2,2-3,2 mm long, lobes up to 0,5 mm long. Stamen-filaments free, up to 6 mm long; anthers with a deciduous apical gland. Ovary up to 1,4 mm long, sessile or very shortly stipitate. Pods dark grey-brown to

black, densely clothed with long spreading greyish-white hairs, $2,2-6,5 \times (0,9)1,1-2,2$ cm, straight or somewhat curved, fibrous, indehiscent, usually much attenuate basally, the stipe up to 2 cm long. Seeds olive, 4,5-9 mm in diam., ellipsoid to subglobose, minutely punctate; areole $4-6 \times 2,5-4,5$ mm, often indistinct.

Found in Somalia, Kenya, Tanzania, southeastern Botswana, southern Rhodesia and the northern Transvaal. Occurs in low lying areas or flats, often in heavy alluvial soils; sometimes in *Colopho*spermun mopane veld.

TRANSVAAL.—2229 (Waterpoort): Dongola Reserve, Farm Breslau 619, Codd & Dyer 3787; Codd 4323. 2328 (Baltimore): N. of Villa Nora, Strey & Schlieben 8674; 12,8 km from Villa Nora on road to Marnitz, Van der Schijff 5331A. Grid ref. unknown: Messina Distr., Limpopo River, Smuts & Gillett 4035.

A. stuhlmannii has a very disjunct distribution in Africa occurring in Somalia, Kenya and Tanzania in the north and in Botswana, Rhodesia and the Transvaal in the south. Although rather a variable species in East Africa, A. stuhlmannii is relatively uniform in our area being always shrubby and with short peduncles 0,6-1,6 cm long, and small pods 2,2-6,5 cm long and up to 2,2 cm wide.

44. Acacia redacta J. H. Ross in Bothalia 11: 231 (1974). Type: Cape, Namaqualand, 22,4 km N. of Stinkfontein on way to Jenkinskop, Werger 1518 (PRE, holo.!; K!).

Much branched shrub 0,3-0,6 m high. Bark dark grey-brown, flaking minutely; young branchlets reddish-brown, densely and persistently appressed pubescent, with numerous small conspicuous dark purplish glands scattered in amongst the hairs. Stipules spinescent, in pairs, 0,8-1,4 cm long, reddish-brown, straight or often deflexed, slender. Leaves: petiole short, mostly 2-6 mm long, grey-puberulous, adaxial gland absent; pinna 1 pair; rhachillae 0,4-1,8 cm long, subglabrous or puberulous; leaflets 2-4 pairs per pinna, $2-5.5 \times 1.2-3.5$ mm, oblique, oblong or elliptic or ± subrotund, apex rounded or obtuse, sparingly to densely appressed pubescent on both surfaces or on the lower surface only, midrib and lateral nerves not visible or inconspicuous beneath, with minute reddish glands at the point of attachment of the leaflets. Inflorescences apparently capitate, reduced, on axillary peduncles; flowers 2-4 per inflorescence or rarely apparently solitary. Flowers apparently pinkish; peduncles 2-6 mm long, conspicuously glandular, usually densely appressed pubescent, Calvx cupular, 0,8-1,2 mm long, densely pubescent. Corolla 4-6 mm long, lobes tinged with red or purple apically, densely appressed pubescent or tomentellous. Stamen-filaments 14-17 mm long, pinkish, shortly connate basally and tubular for ± 2 mm. Ovary $\pm 1,5$ mm long, shortly stipitate. Pods pinkish-brown, $2,6-3,2\times0,9-1,1$ cm, linear-oblong, straight, 1-2-seeded, densely appressed grey-puberulous, with small conspicuous dark purplish sessile glands among the hairs, dehiscent, acute or acuminate apically. Seeds not seen.

Restricted to the north western Cape Province. Occurs most frequently on schistoid granite ridges.

CAPE.—2817 (Vioolsdrif): 20,8 km N. of Stinkfontein (—CB), Leistner 3401; 22,4 km N. of Stinkfontein on way to Rosyntjieberg (—CB), Werger 428; 22,4 km N. of Stinkfontein on way to Jenkinskop (—CB), Werger 1518; near Rosyntjieberg (—CB), Van der Merwe 1828.

A. redacta differs from all other species in our area in having reduced inflorescences which contain only 2-4 flowers or, rarely, the flowers appear to be solitary. This reduction in the number of flowers per "head" is coupled with an increase in the size of the individual flowers, the flowers being larger than in most other species of African Acacia. A. redacta is also unusual in that the stamen-filaments are shortly united basally. The pods dehisce longitudinally from the apex downwards and the two valves diverge. More material is required and the flower colour needs confirmation.

A. redacta appears to have a very restricted distribution. The plants are of very small stature but this is thought to be the result of the extreme and inhospitable environment they occupy, an environment which is conducive to shrubbiness.

Insufficiently known species

45. Acacia sp.

Shrub; young branchlets glabrous, yellowish- to reddish-brown, epidermis splitting and peeling away to reveal a rusty-red inner layer. Stipules spinescent, in pairs, up to 3,2 cm long, straight. Leaves glabrous throughout: petiole 0.5-2 cm long, primary leaves with a large gland up to 4 × 2 mm situated immediately above the pulvinus, secondary leaves without a gland; rhachis 0-2 cm long, projecting at the end in a short rigid persistent deflexed hook or claw, with a slightly raised gland at the point of attachment of each pinna pair; pinnae 1-2 pairs, primary leaves with 2 pairs, secondary leaves with 1 pair; leaflets 5-8 pairs per pinna, $8-18 \times 3-9$ mm, oblong to obovate-oblong, acute or rounded apically, sometimes slightly emarginate, midrib and usually several other

basal and lateral nerves + raised and conspicuous on the lower surface, glabrous throughout. Inflorescences capitate, solitary or fascicled on axillary peduncles, terminal. Flowers sessile; peduncles 3,2-4,2 cm long, glabrous but with few to many scattered sessile glands; involucel at or near the middle of the peduncle. Calyx very shortly lobed, \pm 2,25 mm long, glabrous except for apices of lobes. Corolla ± 3 mm long, glabrous except for apices of lobes. Stamens free, up to 6 mm long; anthers with a deciduous apical gland. Ovary shortly stipitate, ± 1,25 mm long; style \pm 4 mm long. *Pods* immature, $3,5-7 \times 0,9-1$ cm, slightly curved to falcate, apex obtuse or acute, probably longitudinally dehiscent, valves distinctly venose, glabrous, very sparingly glandular. Seeds immature.

Known from a single gathering from the eastern Transvaal.

TRANSVAAL.—2430 (Pilgrim's Rest): 10 km N. of Burgersfort (-CB), W.F. Stuurman W 34.

There are 9 sheets of *Stuurman* W 34 and they exhibit quite a range of variation in leaflet shape and size. Unfortunately there is no information on flower colour, the ecological preferences of the plant, or the species with which it was associated. It is not known whether this was a single isolated plant or whether it is locally common.

Stuurman W 34 does not match material of any other Acacia species. Superficially the specimens look like extremely robust specimens of A. karroo. However, they differ from A. karroo in having much larger leaflets with±raised and conspicuous venation on the lower surface, longer peduncles and slightly wider pods than in "typical" A. karroo. Although there is no information on flower colour, it appears as though the flowers were bright golden yellow as in A. karroo.

The robust leaves and large leaflets of Stuurman W 34 are reminiscent of A. robusta subsp. robusta but the largest leaflets are larger than those recorded in A. robusta and, in addition, differ in having some ± raised and conspicuous nerves on the lower surface. In A. robusta the flowers are pale yellowish-white and the involucel is near the base to just over $\frac{1}{2}$ way up the peduncle, while in Stuurman W 34 the involucels are at or near the middle of the peduncle. The pods are quite different and much smaller than those of A. robusta.

From the limited material and information available it appears that *Stuurnan* W 34 is most closely allied to *A. karroo* or to a related species. More material and detailed field observations and notes are required to enable the identity and affinities of *Stuurnan* W 34 to be established with certainty. The possibility that *Stuurnan* W 34 is of hybrid origin cannot be excluded at this stage.

46. Acacia schlechteri Harms in Bot. Jahrb. 51: 367 (1914); Ross in Bothalia 11: 234 (1974). Type: Mozambique, Ressano Garcia, Schlechter 11901 (B, holo. †; Z, iso!).

? Tree. Branchlets dark grey or blackishbrown, young extremities very sparingly pubescent. Prickles paired, recurved, short. Leaves: petioles, rhachides and rhachillae sparingly pubescent: petiole and rhachis together + 4-6 cm long; pinnae 2-5 pairs; rhachillae 1-4 cm long; leaflets 3-6 pairs per pinna, very variable in size and shape, $7-14 \times$ 4-8 mm, obliquely obovate-oblong or oblong, asymmetric basally, discolorous, glabrous throughout or with few marginal cilia, sometimes with a small basal tuft of hairs to one side of the midrib on the lower surface. Inflorescences spicate; spikes 5-9 cm long, axes sparingly pubescent. Calvx glabrous or with occasional scattered hairs, sometimes sparingly pubescent. Pods unknown.

Young, in Candollea 15: 123 (1955), recorded A. schlechteri from the eastern Transvaal but the specimen cited, and on which he based his description of the pod, namely Rogers 18537 (PRE), is in fact Albizia anthelmintica (A. Rich.) Brongn. The precise identity of A. schlechteri is not absolutely certain but no specimen matching the type or fitting the description has been recorded from our area.

A. schlechteri is possibly a local variant of A. goetzei Harms subsp. goetzei. More material from the type locality and field studies are required in an attempt to establish the identity of A. schlechteri.

47. Acacia callicoma Meisn. in Hook., Lond. J. Bot. 2: 104 (1843). Type unknown.

? Tree. Branches unarmed, glabrous, lenticellate. Stipules not evident. Leaves: petiole and rhachis together 10 cm long, terete, glabrous, petiole with an oblong sessile adaxial gland; pinnae 8 pairs; rhachillae 2,5-3,75 cm long; leaflets 12-14 pairs per pinna, $14-16 \times 6-8$ mm, semihastateoblong, acute apically, rounded-truncate basally, margins ciliate. Inflorescence a terminal panicle, branchlets patent; peduncles 4-8 mm long, solitary or rarely paired. Flowers in round heads, sessile, hermaphrodite. Calyx and corolla infundibuliform, green, puberulous outside. Calyx half as long as the corolla, shortly 5-lobed. Corolla 5 mm long, 5-lobed. Stamens \pm 20; filaments united below, reddish, exceeding the corolla. Pods unknown.

Meisner based his description of A. callicoma on a specimen without fruits and of unknown provenance, "loco natali incerto, aut Port Natal, aut Ins. S. Yago Promontorii viridis", seen in Krauss's herbarium. No type specimen was cited and no specimen bearing this name or any further reference to the species in literature has been traced. Neither Harvey in Fl. Cap., vol. 2 (1862), nor Bentham in his revision of Mimoseae in Trans. Linn. Soc. Lond., Vol. 30 (1875) mention A. callicoma. The description suggests that the specimen Meisner saw was not an Acacia but, in the absence of a specimen, the precise identity of A. callicoma remains unknown.

Naturalized and cultivated species

The distribution of most of the naturalized and cultivated species in our area is much wider than indicated here but few specimens are available for citation.

48. Acacia farnesiana (L.) Willd., Sp. Pl. 4: 1083 (1806); Benth. in Fl. Austral. 2: 419 (1864); Oliv. in F.T.A. 2: 346 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 502 (1875); Bak.f., Leg. Trop. Afr. 3: 835 (1930); Brenan, Checklist Tang. Terr. 334 (1949); Gilbert & Boutique in F.C.B. 3: 164 (1952); Torre in C.F.A. 2: 278 (1956); Keay in F.W.T.A. ed.2, 1: 499 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 111, fig. 16/38 (1959); in F.Z. 3,1: 111 (1970); Ross, Fl. Natal 193 (1973); in Bothalia 11: 465 (1975). Type: Aldinus, Exact. Descr. Rar. Pl.Romae Hort. Farnesiano 4 (1625) (lecto.!).

Mimosa farnesiana L., Sp. Pl. 1:521 (1753); Ross in Bothalia 11:471 (1975). Type as above.

Shrub or small tree to 4 m high; young branchlets grey to reddish-brown or purplish, epidermis not obviously peeling off, with numerous somewhat transversely elongated lenticels, glabrous or almost so. Stipules spinescent, in pairs, usually short, up to 1,5(3) cm long, straight, slender, never inflated; "ant-galls" and other prickles absent. Leaves bipinnate: petiole sparingly to \pm densely pubescent, usually with a small gland; rhachis sparingly to ± densely pubescent, often with a small gland below the junction of the top pinna pair; pinnae 2-7 pairs; leaflets 10-21 pairs, $2-7 \times 0.75-1.75$ mm, midrib and lateral nerves visible and somewhat raised beneath, glabrous throughout or with few inconspicuous marginal cilia. Inflorescences capitate, on axillary peduncles, solitary or in pairs or threes. Flowers bright golden-yellow, sweetly scented; peduncles sparingly to \pm densely pubescent basally, sparingly glandular; involuced apical. Calyx and corolla glabrous except for the apices of the lobes. Pods dark brown to blackish, $4-7.5 \times 0.9-1.5$ cm, straight or curved,

subterete and turgid, glabrous, tardily dehiscent, finely longitudinally striate. Seeds chest-nut-brown, $7-8 \times 5,5$ mm, elliptic, thick, only slightly compressed; areole $6-7 \times 4$ mm.

Probably a native of tropical America, doubtfully so in Africa. Widely introduced in the tropics and often becoming wild. Only planted or an escape from cultivation in our area.

TRANSVAAL.—2528 (Pretoria): Wonderboom Poort, at the footpath of stones laid across the Aapies River, Gerstner 5519. 2531 (Komatipoort): Komatipoort, Pole Evans sub PRE 18281.

NATAL.—2930 (Pietermaritzburg): Durban Botanic Gardens, Ross 1714.

CAPE.—2824 (Kimberley): Kimberley, Wilman sub BOL 15701.

A. farnesiana is grown for ornament and for its fragrant flowers which are used to make perfume. The pods of A. farnesiana are very distinctive and enable the species to be easily recognized. In the absence of pods, it will be helpful to recall that no other African Acacia has the following combination of characters: absence of "ant-galls", leaflets with the lateral nerves raised and somewhat prominent beneath, apical involucels, and bright golden-yellow flowers in non-paniculate heads.

A further very significant distinguishing feature of A. farnesiana is that the anthers lack, even in bud, the small deciduous apical gland which is present in all of the indigenous capitate-flowered acacias occurring in our area.

49. Acacia mearnsii De Wild., Pl. Bequaert. 3: 61 (1925); Brenan in F.T.E.A. Legum.-Mimos.: 95, fig. 15/21 (1959); Brenan & Melville in Kew Bull. 14: 37 (1960); Tindale in Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 231 (1962); Brenan in F.Z. 3, 1: 111 (1970); Court in Willis, Handb. Pl. Victoria 2: 243 (1972); Tindale in Beadle, Evans & Carolin, Fl. Sydney Region 275 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11: 465 (1975). Type: Kenya, near Thika, Mearns 1092 (BR, lecto.; BM.!).

A. decurrens sensu Bak.f., Leg. Trop. Afr. 3:853 (1930) saltem pro parte, non Willd. sensu stricto. A. mollissima sensu auct. mult., Benth. in Hook., Lond. J. Bot. 1:385 (1842); Burtt Davy, Fl. Transv. 2:345 (1932); Brenan, Checklist Tang. Terr. 333 (1949); Salter in Adamson & Salter, Fl. Cape Penins. 454 (1950); F. White, For. Fl. N. Rhod. 82 (1962), non Willd.

Unarmed tree up to 15 m high with a conical or rounded crown; bark grey-brown to blackish, smooth or rough on very old trunks; young branchlets angular; all parts (except flowers) \pm densely pubescent or puberulous, indumentum on young parts often golden. Leaves bipinnate: petiole

1-2,5 cm long, often with a gland above; rhachis usually 4-12 cm long, with numerous raised glands all along its upper surface both at and between the junctions of the pinnae pairs; pinnae 8-21 pairs; leaflets 15-70 pairs. $1,5-4 \times 0,5-0,75$ mm, linear-oblong, appressed-pubescent or glabrous beneath. margins usually with cilia. Inflorescences capitate, in terminal panicles. Flowers pale yellow, fragrant; peduncles 2-6 mm long. Calyx sparingly pubescent especially towards the apices of the lobes. Corolla glabrous or almost so. *Pods* $(1,6)3-10 \times 0,5-0,8$ cm, iointed, almost moniliform, + grev- puberulous, dehiscing longitudinally along one margin only, straight or slightly curved. Seeds black, \pm 5 \times 3,5 mm, elliptic, compressed, smooth; caruncle conspicuous; areole 3.5 \times 2 mm.

Introduced from Australia and now widespread in parts of the Transvaal, Swaziland, Natal and the Cape Province.

TRANSVAAL.—2430 (Pilgrim's Rest): Belvedere 26N forest, ± 29 km from Pilgrim's Rest, Davidson & Mogg 33515. 2528 (Pretoria): Waterkloof, Pretoria, Schlieben 10090. 2530 (Lydenburg): 26,4 km S.S.E. of Lydenburg, D. Morris 58.

A. mearnsii is the well-known Black Wattle which is economically important for the tannin content of the bark. The wood is used for firewood and for building.

By a strange mischance A. mearnsii, the earliest valid name for this Australian species, is based on a specimen collected in Kenya and thought by De Wildeman to be endemic there.

50. Acacia dealbata Link, Enum. Hort. Berol. 2: 445 (1822), non A. dealbata A. Cunn. (1825); Benth. in Fl. Austral. 2: 415 (1864); in Trans. Linn. Soc. Lond. 30: 497 (1875); Burtt Davy, Fl. Transv. 2: 346 (1932); Brenan, Checklist Tang. Terr. 332 (1949); in F.T.E.A. Legum.-Mimos.: 50 (1959); Salter in Adamson & Salter, Fl. Cape Penins. 455 (1950); Tindale in Beadle, Evans & Carolin, Handb. Vasc. Pl.

Sydney Distr. & Blue Mts. 231 (1962); Brenan in F.Z. 3,1:112 (1970); Court in Willis, Handb. Pl. Victoria 2:245 (1972); Tindale in Beadle, Evans & Carolin, Fl. Sydney Region 273 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11:465 (1975). Type: a plant cultivated at Berlin.

A. decurrens var. mollis Lindl. in Bot. Reg. 5: t.371 (1819).

Unarmed shrub or tree up to 15 m high with a conical or rounded crown; bark greybrown to blackish, smooth or rough on very old trunks; young branchlets usually densely short-pubescent, rarely subglabrous, \pm greypruinose, indumentum grey or sometimes yellowish at first and then grey. Leaves bipinnate, often glaucous; petiole 0,5-2 cm long, eglandular; rhachis 2,5-10 cm long, with a raised gland on its upper surface at the junction of each pair of pinnae, but without other glands in between the pinnae pairs as in A. mearnsii; pinnae (5)10-26 pairs; leaflets in 17-50 pairs, $2-5,5 \times 0,4-0,7$ mm, linear-oblong, sparingly to \pm densely pubescent or glabrous beneath, margins with or without cilia. *Inflorescences* capitate, panicled or racemose. Flowers bright yellow; peduncles densely pubescent, up to 6 mm long. Calyx and corolla glabrous except for apices of the lobes. Pods $3-8 \times 0,7-1,3$ cm, not or only slightly moniliform, dehiscing longitudinally along one margin only, straight or slightly curved. Seeds brown to blackish-brown, $5-6 \times 3-3.5$ mm, elliptic, compressed, smooth: caruncle conspicuous; areole $3.5-4 \times 0.75-1.5$ mm.

Introduced from Australia.

TRANSVAAL.—2526 (Zeerust): Swartruggens, Sutton 1031. 2528 (Pretoria): E. of Pretoria, Kinges 1781. 2529 (Witbank): Loskop Dam Reserve, Theron 1752. 2531 (Komatipoort): Kruger National Park, Pretoriuskop-Seekoeigat, Van der Schijff 3177. 2628 (Johannesburg): Melville Koppies, Johannesburg, MacNae 1161 (BOL). 2629 (Bethal): Ermelo, Burtt Davy 594.

NATAL.—2730 (Vryheid): near Grootspruit, Strey 8053. 2930 (Pietermaritzburg): Hilton Road, Ross 2105; farm Mountain Glen, Dargle, Taat 1025.

LESOTHO.—2927 (Maseru): Roma, Ruch 16; Mamathe's Jacot-Guillarmod 1426.

CAPE.—3318 (Cape Town): Cape Town, Gerstner 6147. 3326 (Grahamstown): 1820 Settlers Nature Reserve, Troughton 227.

A. dealbata, commonly known as the Silver Wattle, is sometimes confused with A. nuearnsii. It differs from the latter in lacking the glands in between

the pinnae pairs along the upper surface of the leafrhachis, in being more pruinose, and in having wider usually less moniliform pods.

51. Acacia decurrens Willd., Sp. Pl. 4: 1072 (1806); Benth. in Fl. Austral. 2: 414 (1864); in Trans. Linn. Soc. Lond. 30: 496 (1875); Burtt Davy, Fl. Transv. 2: 345 (1932); Tindale in Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 230 (1962); Court in Willis, Handb. Pl. Victoria 2: 244 (1972); Tindale in Beadle, Evans & Carolin, Fl. Sydney Region 273 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11: 466 (1975). Type from Australia, unknown.

Mimosa decurrens Donn, Hort. Cant. 1:114 (1796) nomen nudum.

Unarmed tree up to 12 m high with a conical or rounded crown; young branchlets prominently angled, sometimes with winglike ridges 1-2 mm high, glabrous or the very young shoots slightly tomentose-pubescent. Leaves bipinnate, green, decurrent: petiole angular, 1,5-3,5 cm long, often eglandular; rhachis 3-10 cm long, with a raised gland just below the junction of each pinna pair; pinnae (5)8-15 pairs; leaflets 15-35 pairs, $6-15 \times 0,3-0,75$ mm, linear, usually glabrous throughout. Inflorescences capitate, panicled or racemose. Flowers bright goldenyellow; peduncles 2-5 mm long. Calyx sparingly pubescent on apices of lobes. Corolla glabrous or almost so. Pods brown or dark brown, $3.5-10 \times 0.4-0.7$ cm, not or only slightly moniliform, dehiscing longitudinally along one margin only, straight or slightly curved. Seeds brown to blackishbrown, \pm 5 \times 3,5 mm, elliptic, compressed, smooth; caruncle conspicuous; areole ± 3.5×2 mm.

Introduced from Australia.

TRANSVAAL.—2630 (Carolina): 8 km from Carolina on road to Badplaas, *Brunnnitt 12418* (K).

NATAL.—2930 (Pietermaritzburg): Winterskloof, Ross 2130.

CAPE.—3318 (Cape Town): Stellenbosch, Garside 1246 (K).

A. decurrens, commonly known as the Green Wattle, is readily distinguished by its long narrow leaflets from all of the other introduced Acacia species with bipinnate leaves in our area.

A. decurrens is usually attributed to "(Wendl.) Willd." with Mimosa decurrens Wendl., Bot. Beob. 57 (1798), being taken as the basionym. However, Willdenow cited only Mimosa decurrens Donn, Hort. Cant. 1: 114 (1796) which is a nomen nudum. As he

provided no reference to Wendland, either direct or indirect, Willdenow's binomial must be treated as a new name.

52. Acacia baileyana F. Muell. in Trans. & Proc. Roy. Soc. Victoria 24: 168 (1887); Brenan in F.T.E.A. Legum-Mimos.: 50 (1959); Tindale in Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 231 (1962); Brenan in F.Z. 3, 1: 112 (1970); Court in Willis, Handb. Pl. Victoria 2: 244 (1972); Tindale in Beadle, Evans & Carolin, Fl. Sydney Region 273 (1972); Ross in Bothalia 11: 466 (1975). Type from Australia.

Unarmed shrub or tree up to 5 m high: young branchlets subglabrous to sparingly pubescent. Leaves bipinnate, glaucous: petiole very short, 2-8 mm long; rhachis 0-1,2 cm long, with a gland at the junction of each or only the top few pinnae pairs; pinnae (1)2-4 pairs, crowded; leaflets 12–20 pairs, 3–7 × 0,8-1,5 mm, linear-oblong, often slightly falcate, glabrous throughout or with few marginal cilia. Inflorescences capitate, in axillary racemes or panicles longer than the leaves. Flowers bright yellow; peduncles 2-5 mm long. Calyx and corolla glabrous or almost so. *Pods* brown, $4-10 \times 0.8-1.4$ cm, straight or slightly curved, margins entire or only slightly and irregularly constricted between some of the seeds, dehiscing longitudinally along one margin. Seeds blackish, \pm 6 \times 3 mm, smooth; caruncle conspicuous; areole + 5 \times 2 mm.

Introduced from Australia.

TRANSVAAL.—2528 (Pretoria): Prince's Park, Repton 1B. 2626 (Klerksdorp): near Rooijantjiesfontein, Kinges 1475.

SWAZILAND.—2631 (Mbabane): 10 km W. of Mbabane on main road to Transvaal, *Brummitt 12425* (K)

NATAL.—2930 (Pietermaritzburg): Manderston, Ross 1203.

CAPE.—3125 (Steynsburg): Grootfontein, *Theron 612*. 3326 (Grahamstown): Grahamstown, *Troughton 65*.

53. Acacia armata R.Br. in Ait.f. Hort. Kew, ed. 2, 5: 463 (? Dec. 1813); DC., Prodr. 2: 449 (1825); Benth. in Fl. Austral. 2: 347 (1864); in Trans. Linn. Soc. Lond. 30: 461 (1875); Salter in Adamson & Salter, Fl. Cape Penins. 453 (1950); Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 224 (1962); Court in Willis, Handb. Pl. Victoria 2: 216 (1972); Beadle, Evans & Carolin, Fl. Sydney Region 265 (1972); Ross in Bothalia 11: 466 (1975).

Type: South Australia, Bay IX Memory Cove, Kangaroo Island, R. Brown (BM, holo.!; E).

Shrub up to 3,5 m high; young branchlets reddish-brown or brown, angular-striate. usually hirsute-pubescent, seldom glabrous. Stipules spinescent, in pairs, slender, divaricate, up to 1 cm long. Leaves phyllodic, apparently simple, $0.5-1(1.5) \times 0.2-0.6$ cm, obliquely-ovate to oblong or narrowly lanceolate, undulate, with a single nearly centric midrib, apex obtuse or distinctly mucronate, glabrous throughout or sometimes with hairs on the margins and on the midrib. Inflorescences capitate, on axillary peduncles which are about as long as the phyllodes. Flowers bright yellow. Calvx lobed but not separating into sepals, \pm half as long as the corolla. Petals narrow, glabrous. *Pods* straight or \pm falcate, 2,5-6 \times 0,2-0,6 cm, dehiscent, villous, rarely glabrous or hispid. Seeds dark brownish-black, \pm 7× 2,5 mm, smooth; caruncle conspicuous.

Introduced from Australia.

CAPE.—3318 (Cape Town): Cape Peninsula, Rhodes Estate, Salter 7619 (BOL); above Rhodes Memorial and Groote Schuur Hospital, Gerstner 6141.

It is quite probable that A. paradoxa DC., Cat. Hort. Monsp. 74 (Feb.-Mar. 1813), is an earlier name for this species. However, until this has been definitely established, the name A. armata is retained.

54. Acacia podalyriifolia A. Cunn. ex G. Don, Gen. Syst. 2: 405 (1832); Benth. in Fl. Austral. 2: 374 (1864); in Trans. Linn. Soc. Lond. 30: 474 (1875); Brenan, Checklist Tang. Terr. 332 (1949); in F.T.E.A. Legum.-Mimos.: 51 (1959); Beadle, Evans & Carolin, Handb. Vasc. Fl. Sydney Distr. & Blue Mts. 225 (1962); Brenan in F.Z. 3,1: 113 (1970); Beadle, Evans & Carolin, Fl. Sydney Region 267 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11: 466 (1975). Type: Australia, Queensland, Birnam Range, Brisbane River, A. Cunningham 157/1828 (K, holo.!).

Unarmed shrub or small tree up to 6 m high; young branchlets densely grey-pubescent. Leaves phyllodic, apparently simple, glaucous, mostly $1,5-4\times1-2$ cm, ovate to elliptic or elliptic-oblong, often oblique, with a single main longitudinal nerve and finely but distinctly penninerved, sparingly to densely pubescent, with 1 or 2 marginal glands.

Inflorescences capitate, in axillary racemes which are usually longer than the phyllodes, mostly terminal. Flowers bright yellow; peduncles pubescent, up to 7 mm long. Calyx less than half as long as the corolla, pubescent apically. Petals \pm free, hirsute. Pods brown, glabrous or pubescent, 4–8,5 \times 1,5–2 cm, straight or almost so, flattened, margins often \pm undulate, dehiscing longitudinally. Seeds dark brownish-black, 6–7 \times \pm 3,5 mm, smooth, compressed; caruncle conspicuous; areole 3,5–4 \times \pm 1,5 mm.

Introduced from Australia.

TRANSVAAL.—2528 (Pretoria): Riviera, Pretoria, Schlieben 10083.

NATAL.—2930 (Pietermaritzburg): slopes below World's View, *Ross 2104*.

CAPE.—3318 (Cape Town): Stellenbosch, Louw 5. 3326 (Grahamstown): Grahamstown, Troughton 44.

55. Acacia saligna (Labill.) Wendl., Comm. Acac. 26 (1820); Benth. in Fl. Austral. 2: 364 (1864); in Trans. Linn. Soc. Lond. 30: 469 (1875); Court in Willis, Handb. Pl. Victoria 2: 229 (1972); Maslin in Nuytsia 1(4): 334 (1974); Ross in Bothalia 11: 467 (1975). Type from Western Australia, Labillardiere (Fl, lecto.).

Mimosa saligna Labill., Pl. Nov. Holl. 2:86, t.235 (1806). Type as above.

Acacia cyanophylla Lindl., Bot. Reg. 25: Misc. 45 (1839); Benth. in Fl. Austr. 2: 364 (1864); in Trans. Linn. Soc. Lond. 30: 469 (1875); Salter in Adamson & Salter, Fl. Cape Penins. 454 (1950); F. White, For. Fl. N. Rhod. 82 (1962); Roux & Middlemiss in S. Afr. J. Sci. 59: 286 (1963); Henderson & Anderson, Mem. Bot. Surv. S. Afr. 37: 170, fig. 84a, b, c (1966); Brenan in F.Z. 3,1: 112 (1970); Beadle, Evans & Carolin, Fl. Sydney Region 269 (1972); Ross, Fl. Natal 193 (1973). Type from Australia.

Unarmed shrub or tree up to 10 m high; young branchlets slightly angular, glabrous. Leaves phyllodic, apparently simple, glabrous. mostly $8-22 \times 0.5-1.4$ cm (the lower ones sometimes much longer and 4 cm or more wide), usually narrow, linear-lanceolate to linear-oblong or oblanceolate, straight or slightly falcate, much narrowed basally, with a single main longitudinal nerve and finely but distinctly penninerved, sometimes glaucous, with a basal gland (on young plants and coppice shoots bipinnate leaves are sometimes produced at the apex of the phyllode). Inflorescences globose, 6,5-9 mm in diameter, in short axillary racemes. Flowers bright yellow; peduncles 0,6-2,2 cm long. Calyx slightly pubescent apically. Corolla glabrous. Pods brown, $5,5-15 \times 0,5-0,6$ cm, straight or slightly falcate, flattened, margins slightly constricted between some of the seeds, dehiscing longitudinally. Seeds dark brown, $5-7 \times 2,75-3,5$ mm, smooth, compressed; caruncle conspicuous; areole $3,5-5 \times \pm 1,5$ mm.

Introduced into the Cape Province from Australia and now fairly widespread from the Cape Peninsula to the eastern Cape; also introduced into Natal more recently.

S.W.A.—2615 (Luderitz): Luderitz, Kinges 2736. TRANSVAAL.—2528 (Pretoria): Sunnyside, Repton 1861.

NATAL.—2930 (Pietermaritzburg): Botha's Hill, Ross 2132. 2931 (Stanger): Virginia Airport, Ross 2139.

CAPE.—3318 (Cape Town): Ida's Valley, bottom of Hell's Hoogte Pass, Stellenbosch, *Thompson 836*. 3325 (Port Elizabeth): Port Elizabeth, *Begg s.n.* (GRA). 3326 (Grahamstown): road from Port Elizabeth to Grahamstown, *Wells 2603*. 3418 (Simonstown): Tokai, *Burtt Davy sub FHO 20021* (K). 3422 (Mossel Bay): Sedgefield, farm Karawater, bank of Karatara River, *Ross 2410*.

A. saligna, commonly called the "Port Jackson Willow" on account of its pendulous branches and phyllodes, was introduced on the Cape Flats in the 1870's in an attempt to stabilize the shifting dune sands. It proved highly successful for this purpose and soon started spreading by natural means. A. saligna is now found far beyond the area of the Cape Flats and has become a serious menace in many parts of the Cape Peninsula and on the mainland by invading and displacing the indigenous vegetation. A. saligna coppices freely when cut down and in many areas occurs in dense stands. The wood is relatively soft and the branches are brittle.

56. Acacia pycnantha Benth. in Hook., Lond. J. Bot. 1: 351 (1842); Benth. in Fl. Austral. 2: 365 (1864); in Trans. Linn. Soc. Lond. 30: 469 (1875); Salter in Adamson & Salter, Fl. Cape Penins. 455 (1950); Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 226 (1962); Court in Willis, Handb. Pl. Victoria 2: 226 (1972); Beadle, Evans & Carolin, Fl. Sydney Region 269 (1972); Ross in Bothalia 11: 467 (1975). Type from Australia.

Unarmed shrub or tree up to 10 m high; young branchlets terete or almost so, glabrous. Leaves phyllodic, apparently simple, glabrous, $10-20 \times (1)1.5-3$ cm, obovate-lanceolate, distinctly falcate, mostly obtuse apically, narrowed basally, with a single main longitudinal nerve and finely but distinctly penninerved, margin nerve-like, with a fairly large marginal gland near the

base (on young plants and coppice shoots bipinnate leaves are sometimes produced at the apex of the phyllode). Inflorescences globose, in axillary racemes or panicles. Flowers bright yellow; peduncles stout, up to 7 mm long. Calyx about \(\frac{2}{3} \) as long as the corolla, pubescent apically. Corolla \(\pm \) glabrous. Pods brown, 6-12 \times 0, 4-0,7 cm, straight or slightly curved, flattened, margins slightly constricted between some of the seeds, dehiscing longitudinally. Seeds dark brownish-black, 5-7 \times 2,75-3,5 mm, smooth, compressed; caruncle conspicuous.

Introduced from Australia.

CAPE.—3318 (Cape Town): Pinelands, Salter 8767; Cape Town University, Leighton sub BOL 25537. 3418 (Simonstown): Somerset West, Parker 3517 (K). 3420 (Bredasdorp): Potteberg, Van Niekerk sub BOL 23359.

57. Acacia longifolia (Andr.) Willd., Sp. Pl. 4: 1052 (1806), non A. longifolia Paxt. (1846); Benth. in Fl. Austral. 2: 397 (1864); in Trans. Linn. Soc. Lond. 30: 487 (1875); Salter in Adamson & Salter, Fl. Cape Penins. 454 (1950); Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 228 (1962); Henderson & Anderson, Mem. Bot. Surv. S. Afr. 37:170, fig. 84d, e, f (1966); Court in Willis, Handb. Pl. Victoria 2: 241 (1972); Beadle, Evans & Carolin, Fl. Sydney Region 272 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11: 467 (1975). Type from Australia.

 $\it Mimosa\ longifolia\ Andr.,\ Bot.\ Rep.\ t.207$ (1802). Type as above.

Unarmed shrub or tree to 8 m high; young branchlets angular, glabrous or the young shoots minutely pubescent. Leaves phyllodic, apparently simple, glabrous, 6-18 \times 0,7-2 cm, linear-lanceolate or narrowly oblong to oblanceolate, straight or almost so, mucronate apically, sometimes obliquely so, narrowed basally, with 2-5 prominent longitudinal nerves and faintly or conspicuously anastomosing almost longitudinal between the nerves. Inflorescences spicate, axillary, solitary or in pairs; spikes up to 4 cm long. Flowers bright yellow, sessile. Calyx very short. Corolla glabrous. Pods brown, $7-14 \times 0,4-0,6$ cm, cylindrical, straight or slightly curved, margins constricted between the seeds, dehiscing longitudinally along both margins, valves longitudinally wrinkled or striate, acuminate

apically, glabrous. Seeds dark brownish-black, $4-7 \times \pm 2,5$ mm, more or less oblong, smooth, compressed; areole $\pm 3,5 \times 1,5$ mm; funicle not much folded, thickened almost from the base into a small \pm cupular aril enclosing the apex of the seed.

Introduced from Australia.

TRANSVAAL.—2627 (Potchefstroom): Randfontein, *Barnard sub PRE 32122*. 2628 (Johannesburg): Johannesburg, *Moss 5258* (BM).

NATAL.—2930 (Pietermaritzburg): Town Bush Valley, 1,6 km W. of Cascade Falls, Ross 1281 (NU); Hilton Road, Ross 2106.

CAPE.—3318 (Cape Town): Rondebosch, lower slopes of Devil's Peak behind University, White 5002. 3319 (Worcester): Franschhoek. Van der Merwe 1209. 3325 (Port Elizabeth): 24 km up Elands River road, Acocks 21275. 3326 (Grahamstown): road from Port Elizabeth to Grahamstown, Wells 2602. 3418 (Simonstown): near Wynberg, Schlechter 1061 (GRA). 3419 (Caledon): Kogelberg Reserve, Paardeberg, Grobler 17140. 3422 (Mossel Bay): Mossel Bay, Hutchinson s.n. (K).

A. longifolia is commonly known as the Golden Wattle. Like several of the other introduced Australian species, A. longifolia is also invading and displacing the indigenous vegetation in some areas.

A. longifolia is a variable species. Although some of the extremes look very different, they are connected by an almost continuous range of intermediates and consequently cannot be separated satisfactorily. Bentham l.c. :397 (1864) enumerated six forms of A. longifolia.

Beadle, Evans & Carolin l.c. 228 (1962) recognized two varieties, namely, var. longifolia and var. sophorae (Labill.) F. Muell. ex Benth. Var. sophorae has mostly obovate-oblong, oblanceolate or oblong-elliptic phyllodes 1,2–3,6 cm wide and 5–12 cm long, in contrast to the linear or linear-lanceolate phyllodes 0,3–1 cm wide and 7,5–13 cm long of var. longifolia. Although there is no distinct morphological discontinuity between the two, in Australia var. sophorae has somewhat different ecological preferences and tends to occur as a low plant along the coastal sand-dunes, while var. longifolia grows into a larger plant. Specimens from our area are often difficult to place in one variety or the other with certainty.

58. Acacia cyclops A. Cunn. ex G. Don, Gen. Syst. 2: 404 (1832); Benth. in Fl. Austral. 2: 388 (1864); in Trans. Linn. Soc. Lond. 30: 481 (1875); Salter in Adamson & Salter, Fl. Cape Penins. 454 (1950); Roux in S. Afr. J. Sci. 57: 99 (1961); Roux & Middlemiss in S. Afr. J. Sci. 59: 286 (1963); Middlemiss in S. Afr. J. Sci. 59: 419 (1963); Henderson & Anderson, Mem. Bot. Surv. S. Afr. 37: 172, fig. 85 (1966); Ross in Bothalia 11: 468 (1975). Syntypes: Western Australia, King George's Sound, A. Cunningham 104/1818 (K!), 328/1821 (K!).

A. cyclopis A. Cunn. ex Loudon, Hort. Britt. 407 (1830) nomen nudum.

Unarmed shrub or small tree up to 6 m high; young branchlets usually angular and glabrous. Leaves phyllodic, apparently simple, glabrous, $3-9 \times 0,6-1,5$ cm, narrowly-oblong, usually ± straight, sometimes slightly falcate, obliquely mucronate apically, narrowed basally, with 3-5 prominent longitudinal nerves and anastomosing almost longitudinal veins. Inflorescences globose, solitary or two or three in short axillary racemes. Flowers bright vellow; peduncles up to 7 mm long. Calvx pubescent apically, more than half as long as the corolla. Petals free. Pods brown, $5-15 \times 0.8-1.3$ cm, oblong, falcate or variously coiled or spirally twisted, flattened, margins not constricted between the seeds, dehiscing longitudinally along both margins. Seeds dark brown, $5-7 \times 3-4$ mm, smooth, compressed; areole \pm 4 \times 2 mm; funicle thickened, bright red or orange, encircling the seed in a double fold.

Introduced into the Cape Province from Australia and now widespread in coastal areas from Lambert's Bay in the north-west to Kidd's Beach in the north-east.

S.W.A.—2615 (Luderitz): Luderitz, Kinges 2732.

CAPE.—3318 (Cape Town): Hell's Hoogte, Stellenbosch, Taylor 7298. 3325 (Port Elizabeth): Port Elizabeth, Theron 1142. 3326 (Grahamstown): Kowie River, Wells 2580. 3418 (Simonstown): Cape Peninsula, Rodin 3287A. 3419 (Caledon): ncar Caledon, Gilliland A62 (BM). 3422 (Mossel Bay): Sedgefield, farm Karawater, bank of Karatara River, Ross 2408. 3423 (Knysna): bank of Lagoon, road to Knysna Heads, Bos 935.

Like A. saligna, A. cyclops was introduced on the Cape Flats in the 1870's in an attempt to stabilize the shifting dune sands. It proved highly successful for this purpose and soon started spreading by natural means. A. cyclops is now found far beyond the area of the Cape Flats and has become a serious menace in many parts of the Cape Peninsula and on the mainland by invading and displacing the indigenous vegetation. In many areas A. cyclops occurs in dense almost impenetrable stands.

Unlike A. saligna, A. cyclops does not usually coppice when cut down. The wood of A. cyclops provides a useful firewood.

A. cyclops is commonly known as "Rooikrans" on account of the bright red funicle which encircles the seed. The pods usually remain attached to the plant long after the ripe seeds have been shed.

A number of species of birds feed on the conspicuous funicles and assist in the distribution of A. cyclops (see Middlemiss in S. Afr. J. Sci. 59: 419, 1963)

59. Acacia melanoxylon R.Br. in Ait.f. Hort. Kew ed. 2,5: 462 (1813); Benth. in Fl. Austral. 2: 388 (1864); in Trans. Linn. Soc. Lond. 30: 481 (1875); J. Phillips in Mem. Bot. Surv. S. Afr. 14: 291 (1931); Salter in Adamson & Salter, Fl. Cape Penins. 454 (1950); Beadle, Evans & Carolin, Handb. Vasc. Pl. Sydney Distr. & Blue Mts. 227 (1962); Court in Willis, Handb. Pl. Victoria 2: 236 (1972); Beadle, Evans & Carolin, Fl. Sydney Region 270 (1972); Ross, Fl. Natal 193 (1973); in Bothalia 11: 468 (1975). Type: Tasmania, Port Dalrymple, R. Brown (BM, holo.!).

Unarmed tree up to 20 m high; young branchlets angular, glabrous or the young shoots minutely pubescent. Leaves phyllodic, apparently simple, glabrous, mostly $6-12 \times$ 0,6-1,2(2,5) cm, linear-lanceolate to oblanceolate or narrowly obovate, straight to falcate, narrowed basally, with 3-7 prominent longitudinal nerves and a conspicuous reticulate venation between the longitudinal nerves (on young plants bipinnate leaves are sometimes produced at the apex of the phyllode). Inflorescences globose, solitary or in short axillary racemes. Flowers pale vellowishwhite; peduncles up to 6 mm long. Calyx more than half as long as the corolla. Corolla glabrous. Pods brown, 5-15 \times 0,6-0,8 cm, oblong, falcate or variously coiled or spirally twisted, flattened, margins thickened, not constricted between the seeds, dehiscing longitudinally along both margins. Seeds dark brownish-black, 4-5 \times \pm 2,5 mm, smooth, compressed; areole \pm 3 \times 1 mm; funicle very long, thickened, almost encircling the seed in a double fold.

Introduced from Australia.

TRANSVAAL.—2528 (Pretoria): Wonderboom Reserve, *Repton 1871*. 2627 (Potchefstroom): Krugersdorp, *Webster sub PRE 32118*. 2628 (Johannesburg): around Johannesburg, *Moss 7082* (BM).

LESOTHO.—2927 (Maseru): Masoeling, Jacot-Guillarmod 2605.

CAPE.—3219 (Wuppertal): Cedar Mts., Algeria forest reserve, *Bos 516*. 3318 (Cape Town): Rondebosch, near University of Cape Town, *White 5066*. 3326 (Grahamstown): Grahamstown, *Roux sub PRE 32121*. 3422 (Mossel Bay): Sedgefield, farm Karawater, banks of Karatara River, *Ross 2409*.

A. melanoxylon, the well-known Blackwood, yields a good timber which is used in the manufacture of furniture. Like several of the other introduced Australian species, A. melanoxylon is also invading and displacing the indigenous vegetation in some areas.

In addition to the species dealt with in some detail above, several species are cultivated in our area. At present, however, there is no evidence to suggest that any of them have become naturalized. The species cultivated are:

60. Acacia elata A. Cunn. ex Benth. in Hook., Lond. J. Bot. 1: 383 (1842), non A. elata Wallich, Cat. 5233 (1832) nomen nudum, non A. elata R. Grah.; Benth. in Fl. Austral. 2: 413 (1864); in Trans. Linn. Soc. Lond. 30: 495 (1875); Summerh. in Bot. Mag. 154: t.9214 (1930); Brenan in F.T.E.A. Legum.-Mimos.: 50 (1959); in F.Z. 3,1: 111 (1970); Tindale in Beadle, Evans & Carolin, Fl. Sydney Region 272 (1972); Ross in Bothalia 11: 469 (1975). Type from New South Wales, Australia.

A. terminalis sensu Court in Handb. Pl. Victoria 2:242 (1972).

Unarmed tree. Leaves bipinnate, large, 30-40 cm long; pinnae 3-5 pairs; leaflets 8-15 pairs per pinna, mostly $2-6\times0$,4-1 cm, lanceolate to linear-lanceolate, often somewhat falcate, usually finely pubescent at least on the lower surface. Flowers pale yellow, in round heads, arranged in axillary racemes or panicles. $Pods\pm9-15\times0$,9-1,3 cm, linear-oblong, straight or curved, the margins irregularly constricted between the seeds, compressed, dehiscing along both margins.

A. elata is easily distinguished from all of the other species with bipinnate leaves by its large leaflets.

Recorded from Krugersdorp in the Transvaal, Gerstner 6671, and Stellenbosch in the Cape, Taylor 7968, but much more widely cultivated.

61. Acacia visite Griseb. in Abh. K. Ges. Wiss. Göttingen 19: 135 (1874); Ross in Bothalia 11: 469 (1975). Type from Argentina.

Unarmed tree. Leaves bipinnate; pinnae 2-7 pairs; leaflets 24-38 pairs per pinna, 6-9 × 0,8-1,25(2) mm, linear or linear-oblong, acute apically, midrib almost marginal throughout its length and usually pubescent. Flowers in round heads; inflorescences

solitary, paired or fascicled in the axils of the leaves. *Pods* $7-12 \times 1,4-1,9$ cm, valves thin, dehiscing longitudinally.

Recorded from Capital Park, Pretoria, Repton 1880; Grounds of Division of Botany, Pretoria, Verdoorn sub PRE 32344, Schlieben 10106; Mr Loock's garden in Pretoria, Gerstner sub PRE 32346; Bloemfontein, Potts 3219.

62. Acacia cultriformis A. Cunn. ex G. Don, Gen. Syst. 2: 406 (1832); Benth. in Fl. Austral. 2: 375 (1864); in Trans. Linn. Soc. Lond. 30: 474 (1875); Brenan in F.Z. 3,1: 113 (1970); Ross in Bothalia 11: 469 (1975). Type from New South Wales, Australia.

Unarmed shrub or small tree; young branchlets angular, glabrous. Leaves phyllodic, apparently simple, $0.8-3\times0.6-1.1$ cm, obliquely obovate-lanceolate to ovateriangular, glaucous, glabrous, with a single main longitudinal nerve and finely penninerved, usually with 1 marginal gland, sometimes on a prominent angle. Flowers in small round heads, arranged in axillary racemes which are longer than the phyllodes and are often \pm aggregated terminally. Pods $5-9\times0.5-0.7$ cm, linear-oblong, glabrous, longitudinally dehiscent.

Recorded from Stellenbosch, Garside 1248 (K).

A. cultriformis differs from A. podalyriifolia in being glabrous and in having narrower pods.

63. Acacia retinodes Schlechtend. in Linnaea 20: 664 (1847); Benth. in Fl. Austral. 2: 362 (1864); in Trans. Linn. Soc. Lond. 30: 468 (1875); Stapf & Ballard, Bot. Mag. 153: t.9177 (1929); Brenan in F.T.E.A. Legum.-Mimos.: 51 (1959); Court in Willis, Handb. Pl. Victoria 2: 227 (1972); Ross in Bothalia 11: 469 (1975). Type from Australia.

Unarmed glabrous shrub or small tree. Leaves phyllodic, apparently simple, linear-lanceolate to -oblong or oblanceolate, straight or slightly curved, 4,5-17 cm long, up to 1,5 cm wide, narrowing gradually towards the base, with a single main longitudinal nerve and finely but distinctly penninerved. Flowers in round heads up to 6 mm in diameter; inflorescences on peduncles 3-6 mm long, arranged in short axillary racemes. Pods 7-12 × 0,5-0,7 cm, linear-oblong, flattened, longitudinally dehiscent; funicle encircling the seed in a double fold.

Recorded from Roodeplaat near Pretoria, Du Toit 105, 151, Schlieben & Mendelsohn 12717.

A. retinodes differs from A. saligna in having smaller flower-heads, shorter peduncles and funicles which encircle the seeds in a double fold.

64. Acacia fimbriata A. Cunn. ex G. Don. Gen. Syst. 2: 406 (1832); Beadle, Evans & Carolin, Fl. Sydney Region 267 (1972); Ross in Bothalia 11: 469 (1975). Type from New South Wales, Australia.

Unarmed shrub or small tree. Leaves phyllodic, apparently simple, linear to narrowly oblong-elliptic, 2-4,5 cm long, 2-5 mm wide, narrowed basally, with a single main longitudinal nerve, margins typically densely ciliate, usually with a rounded gland near the base. Flowers in small round heads, arranged in axillary racemes. Pods linearoblong, straight, flattened, up to 7 cm long and 7 mm wide, dehiscent.

Recorded from the Grounds of the Union Buildings, Pretoria, Repton 2640, Schlieben 10084, Schlieben & Mendelsohn 12881; Grahamstown,

Troughton 228.

65. Acacia adunca A. Cunn. ex G. Don, Gen. Syst. 2: 406 (1832); Maiden, For. Fl. New South Wales 5, part 46: 113-118, t.173 (1911); Ross in Bothalia 11: 469 (1975). Type: Australia, New South Wales, Hunters River, Cunningham 79/1827 (K, holo.!).

A. accola Maiden & Betche in Proc. Linn, Soc. New South Wales 31(4): 734 (1907). Syntypes from Australia.

Unarmed small tree; young branchlets angular, glabrous. Leaves phyllodic, apparently simple, 5-12 cm long, 1,5-3 mm wide (in our area), linear, with a single main longitudinal nerve, usually with an oblique slightly recurved point apically, a fairly conspicuous marginal gland situated a short distance above the base. Flowers in small round heads, arranged in short axillary racemes which are mostly aggregated terminally. Pods reddish-brown when mature, $7-10 \times 0.8-1$ cm, oblong, margins often irregularly constricted, valves thin, umbonate over the seeds, longitudinally dehiscent.

Recorded from the Groot Drakenstein in the Cape Province, Voorligtingsbeampte C4.

66. Acacia maidenii F. Muell. in Linn. Soc. New South Wales Macleav Mem. Vol. 222 : t.29 (1893); Court in Willis, Handb. Pl. Victoria 2: 240 (1972); Beadle, Evans & Carolin, Fl. Sydney Region 271 (1972): Ross in Bothalia 11: 470 (1975). Type from New South Wales, Australia.

Unarmed small to medium-sized tree. Leaves phyllodic, apparently simple, 6-15 \times 0,8-1,5 cm, with 3-7 main longitudinal nerves and almost anastomosing longitudinal veins. Flowers in elongate spikes up to 4 cm long, spikes axillary, solitary or in twos or threes. Pods 4-12 cm long, 3-5 mm wide, variously coiled or twisted, pubescent.

Recorded from the Caledonian Grounds. Pretoria, Repton 3766.

Differs from A. longifolia in having pubescent coiled pods.

67. Acacia viscidula A. Cunn. ex Benth. in Hook., Lond. J. Bot. 1: 363 (1842): in Fl. Austral. 2: 387 (1864); in Trans. Linn. Soc. Lond. 30: 480 (1875); Ross in Bothalia 11: 470 (1975). Type: Australia, New South Wales, banks of Lachlan River, Fraser (K. holo.!).

Unarmed shrub or small tree; young branchlets angular, mostly sparingly pubescent, viscid. Leaves phyllodic, apparently simple, 4,5-10 cm long, 1,25-3 mm wide, linear, narrowed basally, with several longitudinal nerves. Flowers in small round heads, on axillary peduncles, solitary or paired, rarely fascicled; peduncles up to 5 mm long, pubescent. Sepals free or shortly united basally. Corolla pubescent. Pods 4-7 cm long, 3-3,5 mm wide, linear, sparingly to densely pubescent, longitudinally dehiscent.

Recorded on the Cape Peninsula on the slopes below the ruins of Lady Anne Barnard's cottage,

Salter 9044.

68. Acacia pendula A. Cunn. ex G. Don, Gen. Syst. 2: 404 (1832); Benth. in Fl. Austral. 2: 383 (1864); in Trans. Linn. Soc. Lond. 30: 479 (1875); Court in Willis, Handb. Pl. Victoria 2: 238 (1972); Ross in Bothalia 11: 470 (1975). Type from New South Wales, Australia.

Unarmed tree or shrub. Leaves phyllodic, apparently simple, linear to linearoblong or lanceolate, 4,5-8 cm long, 3-9 mm wide, narrowed towards the base, coriaceous, with several inconspicuous longitudinal nerves, often greyish or glaucous. Flowers in small round heads, usually arranged in very short axillary racemes. *Pods* oblong, flattened, $4-8 \times 0.8-1.8$ cm, the margins bordered by a narrow wing 0.5-2 mm wide.

Recorded from a Johannesburg park, Hobson sub PRE 32341; Middelburg, Cape, Loock sub PRE 32340.

3. LEUCAENA

Leucaena Benth. in Hook., J. Bot. 4: 416 (1842); Benth. & Hook. f., Gen. Pl. 1: 594 (1865); Oliv. in F.T.A. 2: 337 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 442 (1875); Taub. in Pflanzenfam. 3, 3: 115 (1892); Bak. f., Leg. Trop. Afr. 3: 814 (1930); Gilbert & Boutique in F.C.B. 3: 231 (1952); Keay in F.W.T.A. ed. 2, 1: 495 (1958); Brenan in F.T.E.A. Legum.—Mimos.: 48 (1959); Hutch., Gen. Fl. Pl. 1: 281 (1964); Brenan & Brummitt in F.Z. 3, 1: 53 (1970). Type species: L. diversifolia (Schlechtd.) Benth., fide Williams in Taxon 13: 300 (1964).

Trees or shrubs, unarmed. Leaves bipinnate, a gland often present at the junction of the lowest pair of pinnae, petiole and rhachis otherwise eglandular or rarely with glands between other pairs of pinnae; pinnae each with one to many pairs of leaflets. Inflorescences capitate, pedunculate, axillary, 1-3 together, often racemosely aggregated. Flowers hermaphrodite, sessile, 5-merous. Calyx gamosepalous, 5-toothed. Petals, 5, free, pubescent or glabrous outside. Stamens 10, free, fertile; anthers mostly eglandular apically. Ovary pubescent or sometimes glabrous. Pods oblong or linear-oblong, usually thinly subcoriaceous, compressed, dehiscing into 2 non-recurving valves. Seeds lying±transversely in the pod, compressed, brown, smooth, unwinged, with endosperm.

A genus of \pm 50 species, one widespread in the tropics and subtropics (*L. leucocephala*), one in the Pacific islands, the rest in tropical America.

The generic name is derived from *leukos*, the Greek word for white; in allusion to the flowers of these plants.

Leucaena leucocephala (Lain.) De Wit in Taxon 10: 54 (1961); Brenan & Brummitt in F.Z. 3,1: 53, t.14 (1970); Ross, Fl. Natal 193 (1973). Type an American plant cultivated in France.

Mimosa leucocephala Lam., Encycl. Méth. Bot. 1:12 (1783). Type as above. M. glauca sensu L., Sp. Pl. ed. 2, 2: 1504 (1763) pro parte, non L., Sp. Pl. 1:520 (1753).

Leucaena glauca sensu auct. mult.: Benth. in Hook., J. Bot. 4: 416 (1842); Oliv. in F.T.A. 2: 337 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 443 (1875); Bak. f., Leg. Trop. Afr. 3: 814 (1930); Gilbert & Boutique in F.C.B. 3: 231 (1952); Torre in C.F.A. 2: 268 (1956); Keay in F.W.T.A. ed. 2,1: 495 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 48 (1959).

Unarmed shrub or small tree to 4 m high; young branchlets densely grey-puberulous. Leaves grey-puberulous: petiole 2-4,5 cm long, often with a gland at the junction of the lowest pair of pinna, glands otherwise absent; rhachis (2,5)7-15 cm long; pinnae (2)3-8 opposite pairs; rhachillae 4-8,5 cm long; leaflets 7-20 pairs, 7-15 × 1,5-4 mm, obliquely oblong-lanceolate, acute apically, puberulous on the margins and sometimes also on the midrib beneath, sometimes

glabrous throughout. Flowers white to pale yellowish-white, in heads up to 1,8 cm in diameter; peduncles up to 3,5 cm long, greypuberulous. Calyx 2-3,5 mm long, densely pubescent apically. Petals 3,5-5 mm long, puberulous apically. Stamens 10, free, filaments 6-7,5 mm long; anthers with scattered hairs. Ovary up to 2 mm long, densely pubescent apically. Pods light to dark brown, $10-18 \times 1,4-1,8$ cm, with a stipe up to 2,5 cm long, oblong, compressed, thinly subcoriaceous, raised over the seeds, dehiscing into 2 non-recurving valves. Seeds $7-9 \times 3,5-5$ mm, elliptic to obovate, glossy.

Widespread in the tropics and subtropics, possibly native only in the New World. Introduced into our area, sometimes escaping and becoming naturalized in Natal.

NATAL.—2831 (Nkandla): Empangeni, Lawn 1599 (NH). 2930 (Pietermaritzburg): Durban Berea Lansdell sub NH 15939. 2931 (Stanger): Nyoni, Gerstner sub NH 22631; 6,4 km N. of Stanger, Edwards 3307; Stanger, Ross 859; New Guelderland, Stewart 130 (NH).

The hairs on the anthers (visible with a hand lens) are a most useful diagnostic character of *L. leucocephala*, and distinguish it from all other Mimosoideae in our area.

FIG. 12.—Leucaena leucocephala. 1, flowering branch, × \(\frac{1}{3}\), Lemos & Balsinhas 22; 2, part of stem to show indumentum, × 4; 3, leaflet, × 3; both from Faulkner 576; 4, flower, × 4, 5, petal, × 4; 6, stamen, × 4; 7, two views of anther, × 8; 8, ovary, × 4, all from Lemos & Balsinhas 22; 9, cluster of pods, × \(\frac{1}{3}\); 11, seed, × 1, all from Faulkner 576. 4. MIMOSA

Mimosa L., Sp. Pl. 1:516 (1753); Gen. Pl. ed. 5:233 (1754); DC., Prodr. 2:425 (1825); Benth. in Hook., J. Bot. 4:358 (1841); Benth. & Hook. f., Gen. Pl. 1:593 (1865); Oliv. in F.T.A. 2:335 (1871); Benth. in Trans. Linn. Soc. Lond. 30:388 (1875); Taub. in Pflanzenfam. 3, 3:115 (1892); Harms in Engl., Pflanzenw. Afr. 3,1:390 (1915); Fawc. & Rendle, Fl. Jam. 4:132 (1920); Bak. f., Leg. Trop. Afr. 3:811 (1930); Phill., Gen. 391 (1951); Gilbert & Boutique in F.C.B. 3:228 (1952); Brenan in F.T.E.A. Legum.—Mimos.:42 (1959); Hutch., Gen. Fl. Pl. 1:282 (1964); Schreiber in F.S.W.A. 58:18 (1967); Brenan & Brummitt in F.Z. 3, 1:47 (1970). Type species: M. pudica L.

Herbs or shrubs, rarely trees (not in our area), sometimes scrambling or climbing, usually armed with prickles. Leaves sensitive, bipinnate or the pinnae seeming almost digitate on account of the very short rhachis, rarely (not in our species) absent or modified to phyllodes; pinnae in 1-21 pairs; pinnae each with few to many pairs of leaflets; stipules often persistent. Inflorescences of ovoid or subglobose heads or (not in our species) spikes, which are pedunculate, axillary, solitary or more usually clustered and often aggregated. Flowers hermaphrodite or male, small, sessile. Calyx often very small and almost inconspicuous. Corolla gamopetalous, 4- or sometimes 3-, 5- or 6-lobed. Stamens free, as many as or twice as many as the corollalobes, fertile; anthers eglandular apically. Ovary usually sessile; stigma terminal. Pods straight or circinate, flat, in our species densely bristly or prickly; at maturity the valves between the margins splitting ±transversely into 1-seeded segments or rarely (not in our species) remaining entire, the margins persisting as an empty frame. Seeds ±compressed, smooth.

A genus of \pm 500 species, widely distributed through the tropics but the vast majority of species found in South America. One species is indigenous in Southern Africa and one species has become naturalized.

The name Mimosa is derived from the Greek word mimos, a mimic. This is in reference to the sensitive collapse of the leaves of some species when touched.

1. Mimosa pigra L., Cent. Pl. 1:13 (1755); Fawc. & Rendle, Fl. Jam. 4:135 (1920); Brenan, Checklist Tang. Terr. 346 (1949); Gilbert & Boutique in F.C.B. 3:230 (1952); O. B. Miller in J.S. Afr. Bot. 18:34 (1952); Brenan in Mem. N.Y. Bot. Gard. 8:429 (1954); Torre in C.F.A. 2:268 (1956); Keay in F.W.T.A. ed. 2, 1:495 (1958); Brenan in F.T.E.A. Legum-Mimos.:43, fig. 13 (1959); F. White, For. Fl. N. Rhod. 93 (1962); Schreiber in F.S.W.A. 58:18 (1967); Brenan & Brummitt in F.Z. 3, 1:49, t. 13 (1970); Ross, Fl. Natal 193 (1973). Type: Aeschynomene spinosa quinta Commelin, Rar. Pl. Amst. 59, t. 30 (1697) (lecto!).

Mimosa asperata L., Syst. Nat. ed. 10, 2: 1312 (1759); Willd., Sp. Pl. 4: 1035 (1806); DC., Prodr. 2: 428 (1825); DC., Mém. Leg. t.63 (1827); Benth. in Hook., J. Bot. 4: 400 (1842); Oliv. in F.T.A. 2: 335

(1871); Benth. in Trans. Linn. Soc. Lond. 30: 437 (1875); Burtt Davy in Kew Bull. 1908: 162 (1908); Eyles in Trans. Roy. Soc. S. Afr. 5: 363 (1916); Bak. f., Leg. Trop. Afr. 3: 812 (1930); Burtt Davy, Fl. Transv. 2: 333 (1932). Type: Origin unknown, Herb. Linnaeus No. 1228·32 (LINN, holo.!).

Shrub to 3 m high, sometimes scandent or rambling; stems armed with broad-based prickles up to 7 mm long, also usually appressed- or sometimes spreading-setose. Leaves sensitive; petioles, rhachides and rhachillae usually setulose: petiole 0,3-1,4 cm long; rhachis 2-12 cm long, with a straight, erect or forward-pointing, slender prickle up to 1 cm long at the junction of each of the (2)4-14 pairs of pinnae, often with other stouter, spreading or deflexed prickles between the pinnae pairs; rhachillae 1,8-3,6 cm long; leaflets in 18-33 pairs, 3-9 × 0,5-

1,25 mm, linear-oblong, ± appressedpubescent, particularly on the lower surface, margins often setulose, venation nearly parallel to the midrib. Stipules up to 5 mm long, often persistent. Flowers pink or mauve, in subglobose pedunculate heads + 1 cm in diameter, 1-2 in the axils of the upper leaves: peduncles 1-3 cm long, setulose. Calyx minute, 0,75-1 mm long, laciniate. Corolla tubular-campanulate, 2-3 mm long, lobes usually densely pubescent or minutely setulose apically. Stamens 8, free, up to 6 mm long; anthers eglandular apically. Ovary sessile, up to 2 mm long, densely villous. Pods clustered, brown, compressed, straight or slightly falcate, $2.5-7 \times 0.8-1.2$ cm, bristly all over, breaking up transversely into segments 3-5 mm long, the margins persisting as an empty frame. Seeds olivebrown, narrowly elliptic, up to 7×3.5 mm. smooth.

Widespread in tropical Africa and America, also in Madagascar and Mauritius. Found on sand or alluvium by rivers and pans and in swamps.

S.W.A.—1712 (Posto Velho): bank of Kunene River at Otjinungua, De Winter & Leistner 5779. 1714 (Ruacana Falls): banks of Kunene River, near Ruacana Falls, De Winter 3657. 1719 (Runtu): river bank at Runtu, behind Native Commissioner's hut, De Winter 3721. 1821 (Andara): Andara Mission Station, De Winter 4148.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve (—CC), *Moll & Strey 3764*; Ndumu Game Reserve, N.E. shore of Nyamiti Pan (—CD), *Ross 1933*.

There is some doubt whether *M. pigra* occurs indigenously in the Transvaal. Burtt Davy, Fl. Transv. 2: 333 (1932), recorded it from the Transvaal stating: "collected by the writer in 1904 (Davy "1535") in subtropical Transvaal (probably nr. Barberton),...; the precise locality is uncertain, however, as the labels of *M. asperata* and *Acacia karroo* (Davy 1535) appear to have been transposed." The specimen referred to, namely, *Burtt Davy* "1535" is *M. pigra* but, as indicated, the locality of collection is not certain.

Repton 401 labelled "probably from northern Transvaal" and Grobbelaar 302 from the garden of a house in Groblersdal are the only other specimens examined from the Transvaal. The origin of all three specimens is therefore uncertain. It is possible that M. pigra occurs indigenously in the Transvaal, but its occurrence needs confirmation.

2. Mimosa pudica L., Sp. Pl. 1:518 (1753); Willd. in L., Sp. Pl. ed. 4, 4:1031 (1806); DC., Prodr. 2:426 (1825); Benth. in Hook., J. Bot. 4:367 (1841); Benth. in Trans. Linn. Soc. Lond. 30:397 (1875);

Fawc. & Rendle, Fl. Jam. 4: 133 (1920); Bak. f., Leg. Trop. Afr. 3: 812 (1930); Brenan, Checklist Tang. Terr. 346 (1949); Gilbert & Boutique in F.C.B. 3: 229 (1952); Brenan in Kew Bull. 10: 184 (1955); Keay in F.W.T.A. ed. 2, 1: 495 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 46 (1959); Brenan & Brummitt in F.Z. 3, 1: 51 (1970). Type: A specimen of a cultivated plant in Hort. Cliffort., Linnaeus (BM, lecto.!).

var. hispida Brenan in Kew Bull. 10: 186 (1955); in F.T.E.A. Legum.-Mimos.: 46 (1959). Type: Java, Junghuhn 719 (K, holo.!).

Annual or perennial herb, sometimes woody below, up to 1 m high, often prostrate or straggling; stems ± sparsely armed with prickles 2-5 mm long, in addition varying from densely hispid (in our variety) to almost subglabrous. Leaves sensitive, unarmed; petioles and rhachillae usually setulose: petiole 1-5,5 cm long; rhachis very short so that the 2 (rarely only 1) pairs of pinnae are subdigitate; rhachillae 2,5-8,8 cm long; leaflets 10-26 pairs, $6-12,5(15) \times 1,2-2,75$ (3) mm, linear-oblong, margins setulose, venation diverging from and not nearly parallel to the midrib. Stipules 8-14 mm long, persistent. Flowers pink or lilac, in shortly ovoid pedunculate heads + 1-1.3 cm long and 0,6-1 cm wide, 1-5 together from the axils: peduncles 1-4 cm long, setulose. Calyx minute, \pm 0,2 mm long. Corolla tubular-campanulate, 2-2,25 mm long, lobes densely grey-puberulous apically. Bracteoles 1,8-2,2 mm long, longer than the corollas in bud, their margins ciliate with setiform hairs which project from 1-1,5 mm beyond the corolla when in bud. Stamens 4, free, up to 5,5 mm long; anthers eglandular apically. *Pods* clustered, brown, compressed, straight or slightly falcate, $1-1.8 \times 0.3-0.5$ cm (excluding the prickles), densely setoseprickly on the margins, breaking up transversely into segments, the margins persisting as an empty frame. Seeds olive-brown, \pm $3.5 \times 3 \text{ mm}$.

Pantropical. Found in disturbed areas. Introduced into our area but showing signs of becoming established in some localities.

NATAL.—2930 (Pietermaritzburg): Natal Herbarium Grounds, H. M. Forbes 1242 (NH); Durban Botanic Gardens, Ross 1993, 3030 (Port Shepstone): Umbogintwini valley, Ward 6212 (E, NH).

5. DESMANTHUS

Desmanthus Willd., Sp. Pl. 4: 1044 (1806) nom. conserv.; Benth. & Hook. f., Gen. Pl. 1: 592 (1865); Oliv. in F.T.A. 2: 334 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 385 (1875); Taub. in Pflanzenfam. 3, 3: 117 (1892); Harms in Engl., Pflanzenw. Afr. 3, 1: 392 (1915); Bak. f., Leg. Trop. Afr. 3: 811 (1930); Hutch., Gen. Fl. Pl. 1: 281 (1964). Type species: D. virgatus (L.) Willd.

Trees, shrubs or perennial herbs, unarmed. Stipules setaceous, persistent. Leaves bipinnate; a gland often present at the junction of the lowest pair of pinnae; pinnae each with several to many pairs of small leaflets. Inflorescences capitate, pedunculate, axillary, solitary. Flowers 5-merous, in ovate-globose heads, all hermaphrodite or the lower neuter and sometimes without petals but with short staminodes. Calyx campanulate, shortly dentate. Petals free or cohering slightly. Stamens 10 or 5, free, exserted; anthers eglandular apically. Ovary subsessile; style subulate or thickened above, stigma terminal. Pods linear, straight or ±falcate, compressed, dehiscing into 2 valves, continuous within or subseptate between seeds. Seeds lying lengthwise or obliquely in the pod, compressed.

A genus of \pm 22 species occurring mainly in the tropics and subtropics of the New World. One species has become naturalized in our area.

Desmanthus is derived from the Greek words desme, a bundle and anthos, a flower.

Desmanthus virgatus (L.) Willd., Sp. Pl. 4:1047 (1806); Oliv. in F.T.A. 2:334 (1871); Benth. in Trans. Linn. Soc. Lond. 30:385 (1875); Bak. f., Leg. Trop. Afr. 3:811 (1930); Torre in C.F.A. 2:267 (1956); Ross, Fl. Natal 194 (1973). Type from India, Herb. Linnaeus No. 1228.13 (LINN., holo.!).

Mimosa virgata L., Sp. Pl. 1: 519 (1753). Type as above.

Unarmed perennial herb or suffrutex up to 1 m high; young stems \pm angular owing to the prominent decurrent striations from the base of each petiole, subglabrous to sparingly puberulous. Leaves sparingly to densely puberulous: petiole 0,2-1,8 cm long, usually with a large flattened discoid or ellipsoid gland immediately below the junction of the lowest pinna pair; rhachis 1-5,5 cm long; pinnae 3-5(7) opposite pairs, rhachillae 1-4 cm long; leaflets 9-20 pairs, 3-8 \times 0,8-1,5 mm, linear to linear-oblong, acute apically, glabrous throughout or with marginal cilia. Stipules setaceous, up to 5

mm long, linear, persistent. Flowers white to pale yellowish-white, in heads up to 0,8 cm in diameter; peduncles up to 5 cm long. Calyx campanulate, tube up to 2.5 mm long, lobes up to 1,5 mm long, glabrous. Petals free, up to 4 mm long, glabrous. Stamens 10, filaments free, linear, 5,5-7 mm long; anthers eglandular apically. Ovary subsessile. glabrous; style slightly thickened above. Pods dark brown, 4-8 cm long, up to 4 mm wide, linear, straight or slightly curved, thinly subcoriaceous, compressed, dehiscing longitudinally. Seeds up to 3×2 mm, slightly compressed, sometimes somewhat angular, lying \pm obliquely in the pod, dark brown; are ole small, up to 1.5×1 mm.

Found mainly in the tropics and subtropics of the New World, naturalized elsewhere. Introduced into our area and now established in a few localities in Natal.

NATAL.—2832 (Mtubatuba): Charters Creek Rest Camp, Ross & Moll 5087. 2930 (Pietermaritzburg): Jesmond Road, Pietermaritzburg, K. D. Huntley 820 (NH, NU); Bisley, Ross 953.

6. NEPTUNIA

Neptunia Lour., Fl. Cochinch. 653 (1790); Guill. & Perr., Fl. Seneg. 238 (1832); Benth. in Hook., J. Bot. 4: 354 (1841); Benth. & Hook. f., Gen. Pl. 1: 592 (1865); Oliv. in F.T.A. 2: 333 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 383 (1875); Taub. in Pflanzenfam. 3.3: 118 (1892); Harms in Engl., Pflanzenw. Afr. 3, 1: 403 (1915); Bak. f., Leg. Trop. Afr. 3: 808 (1930); Gilbert & Boutique in F.C.B. 3: 198 (1952); Torre in C.F.A. 2: 267 (1956); Keay in F.W.T.A. ed. 2, 1: 496 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 40 (1959);

Hutch., Gen. Fl. Pl. 1: 291 (1964); Windler in Austr. J. Bot. 14: 379 (1966); Schreiber in F.S.W.A. 58: 18 (1967); Brenan & Brummitt in F.Z. 3, 1: 45 (1970). Type species: *N. oleracea* Lour.

Herbs, aquatic or terrestrial, unarmed. Leaves bipinnate, frequently sensitive; pinnae each with several to numerous pairs of leaflets. Stipules persistent or deciduous. Inflorescence a globose to ellipsoid head, pedunculate, usually solitary and axilfary. Flowers dimorphic, in the upper part of the head hermaphrodite, in the lower part male or neuter with elongate staminodes. Calyx 5-toothed. Petals 5, free or ±united. Stamens 5 or 10, free, exserted, all fertile in hermaphrodite flowers; anthers glandular or eglandular apically. Pods clustered, membranous to subcoriaceous, oblong to subcircular, compressed, dehiscent. Seeds ±compressed, oblong-ellipsoid to obovoid, smooth.

A genus of 11 species, widely distributed and mostly tropical. Only one species in Africa.

The generic name *Neptunia* is derived from *Neptunus*, latin for Neptune, the god of the sea, rivers and fountains; in allusion to its watery habitat.

Neptunia oleracea Lour., Fl. Cochinch. 654 (1790); Benth. in Hook., J. Bot. 4: 354 (1841); Oliv. in F.T.A. 2: 334 (1871); Benth. in Trans. Linn. Soc. Desmanthus stolonifer DC., Prodr. 2: 444 (1825). Type: Senegal, Perrottet (G—DC).

Neptunia stolonifera (DC.) Guill. & Perr., Fl. Seneg. 239 (1832). Type as for Desmanthus stolonifer. N. prostrata (Lam.) Baill. in Bull. Soc. Linn. Par. 1: 356 (1883); Bak. f., Leg. Trop. Afr. 3: 809 (1930); Gilbert & Boutique in F.C.B. 3: 198 (1952). Syntypes as for Mimosa prostrata Lam. N. natans (L.f.) Druce in Rep. Bot. Soc. Exch. Club Br. Isl. 1916: 637 (1917); Schreiber in Mitt. Bot. Staatssamml. München 2: 285 (1957). Type as for Mimosa natans L.f.

Aquatic herb with swollen, creeping stems, floating or prostrate near the water's edge, with fibrous roots especially at the nodes, glabrous or rarely puberulous when young Leaves very sensitive: petiole 2-6,5 cm long, eglandular; rhachis 1-4,5 cm long, eglandular; pinnae 2-4 pairs; rhachillae 1-6,5 cm

long; leaflets 7-22 pairs, 5-16 \times 1,5-4 mm. oblong, basal ones smaller, glabrous or sparsely ciliate on the margins. Stipules obliquely-ovate, $5-9 \times 3-5$ mm, thin, membranous, faintly nerved. Inflorescences pedunculate, solitary in the axils of the leaves. Flowers yellow, in heads 1-2 cm long; peduncles 6,5-20 cm long, glabrous. Calyx 1-3 mm long, glabrous. Petals 2,5-4 mm long, free or margins \pm cohering. Stamens 10, free, 6-9 mm long; anthers eglandular apically even in bud; staminodes petal-like. $7-20 \times 0,5-1$ mm. Ovary 1,2-2 mm long, stipitate, glabrous; style slender, elongate. Pods clustered, bent almost at right angles to the short basal stipe, $1,3-2,8 \times 0,8-1,2$ cm, broadly oblong, compressed, membranous-coriaceous, dehiscent. Seeds 4-5,5 x 2,7-3,5 mm, + compressed, brown.

Found in the tropics of the Old and New Worlds. Occurs in and near fresh water rivers, pools, lakes and swamps; sometimes in stagnant water.

7. DICHROSTACHYS

Dichrostachys (DC.) Wight & Arn., Prodr. Fl. Ind. Or.: 271 (1834) nom. conserv.; Harv. in F.C. 2: 278 (1862); Benth. & Hook. f., Gen. Pl. 1: 592 (1865); Harv., Gen. Pl. ed. 2: 92 (1868); Oliv. in F.T.A. 2: 332 (1871); Benth. in Trans. Linn. Soc. Lond. 30: 381 (1875); Taub. in Pflanzenfam. 3, 3: 118 (1892); Sim, For. Fl. P.E. Afr. 53 (1909); Harms in Engl., Pflanzenw. Afr. 3, 1: 396 (1915); Bak. f., Leg. Trop. Afr. 3: 807 (1930); Burtt Davy, Fl. Transv. 2: 349 (1932); Phill., Gen. 392 (1951); Gilbert & Boutique in F.C.B. 3: 198 (1952); Torre in C.F.A. 2: 265 (1956); Brenan in F.T.E.A. Legum.-Mimos.: 36 (1959); Hutch., Gen. Fl. Pl. 1: 291 (1964); Schreiber in F.S.W.A. 58: 14 (1967); Brenan & Brummitt in F.Z. 3, 1: 37 (1970). Type species: D. cinerea (L.) Wight & Arn.

Desmanthus Willd. sect. Dichrostachys DC., Mém. Leg. 12: 428 (1826). Cailliea Guill. & Perr. in Guill., Perr. & A. Rich., Fl. Sen.: 239 (1832).

Shrubs or small trees; unarmed or (in our species) some abbreviated lateral shoots terminating in spines; prickles absent. Leaves bipinnate; rhachis glandular at the insertion of some at least of the pinnae; each pinnae with several to many pairs of leaflets. Inflorescences of axillary spikes, solitary or appearing fascicled; upper part of spike cylindric, of hermaphrodite flowers, lower part broader, of differently coloured neuter flowers. Calyx shortly 5-toothed. Petals 5, \pm united below. Stamens 10, all fertile in hermaphrodite flowers; anthers (in our species) with a stalked apical gland which is deciduous. Staminodes of neuter flowers elongate, without anthers. Pods clustered, coriaceous, narrowly oblong or linear, compressed, usually irregularly contorted or spiral, indehiscent or opening irregularly or (not in our species) dehiscent. Seeds (in the African species at least) \pm compressed, ovoid to ellipsoid, smooth.

A genus of \pm 20 species in the tropics of the Old World from Africa to Australia, most species in Madagascar. One species occurs in our area. The generic limits are in need of revision.

The generic name *Dichrostachys* is derived from the Greek words *dis* meaning twice, *chroa* meaning colour, and *stachys* meaning a spike.

Dichrostachys cinerea (L.) Wight & Arn., Prodr. Fl. Ind. Or. : 271 (1834); Benth. in Hook., J. Bot. 4: 353 (1841); in Trans. Linn. Soc. Terr. 344 (1949); Codd, Trees & Shrubs Kruger Nat. Park 58, fig. 54 (1951); Gilbert & Boutique in F.C.B. 3: 202 (1952); O. B. Miller in J.S. Afr. Bot. 18: 31 (1952); Brenan in Mem. N.Y. Bot. Gard. 8: 429 (1954); Torre in C.F.A. 2: 265 (1956); Keay in F.W.T.A. ed. 2, 1: 494, fig. 158 (1958); F. White, For. Fl. N. Rhod. 91 (1962). Type as for M. glomerata.

Shrub or small tree up to 7 m high, sometimes suckering and forming thickets; armed with spine-tipped abbreviated lateral shoots which often bear leaves and inflorescences, other prickles absent. *Bark* yellowishto dark greyish-brown or blackish, usually

rough, sometimes fissured; young branchlets usually \(\pm\) pubescent, sometimes puberulous or glabrous. Leaves extremely variable in size, usually pubescent but sometimes puberulous or glabrous: petiole 0,1-5 cm long; rhachis 1-16 cm long, with a stalked or less frequently a sessile gland at the junction of each pinna pair, or at least the basal and apical pairs; pinnae (2) 4-19 pairs; rhachillae 0,6-7,5 cm long; leaflets 9-41 pairs, $1-12 \times$ 0,3-3 mm (in our area), linear to oblong, glabrous to densely pubescent, margins with appressed or spreading cilia, sometimes glabrous, venation obscure to prominent beneath. Inflorescences of axillary spikes, solitary or apparently fascicled, spikes 2, 5–12 cm long (including peduncle), pendulous; yellow in the upper hermaphrodite part, mauve, pink or sometimes white in the lower neuter part. Calyx 0,6-1,25 mm long. Corolla 1,5-3 mm long. Stamens of hermaphrodite flowers 3-3,5 mm long; staminodes 4-17 mm long. Pods usually dark brown, $2-10 \times 0.5-1.5$ cm (in our area), clustered, variously contorted or spiral, indehiscent. Seeds $4-6 \times 3-4,5$ mm, deep brown, glossy, + compressed.

An extremely variable and taxonomically complex species, widespread in Africa and Asia and reaching Australia. Within our area, D. cinerea occurs commonly in South West Africa, the Transvaal, Swaziland, Natal and the northern Cape Province. It occupies a diverse range of habitats and is a conspicuous component of many communities.

An analysis of the variation within D. cinerea, which resulted in the recognition of a number of infraspecific taxa, was the subject of a very detailed paper by Brenan & Brummitt in Bol. Soc. Brot., Sér. 2, 39: 61-115 (1965). During the preparation of the present account it was found that Brenan & Brummitt's treatment of the species was not altogether acceptable in our area. Consequently, certain modifications have been made to it. The difficulties encountered while attempting to name specimens in our area and the decisions arrived at are discussed in Bothalia 11: 265 (1974). Until the species has been thoroughly investigated in the field, the present treatment can only be regarded as a provisional one. The taxonomic significance of the differential characters employed by Brenan & Brummitt to distinguish some taxa must be evaluated. Field studies may also yield valuable information about the ecological preferences of some of the taxa.

D. cinerea, commonly known as the Sicklebush or Sekelbos, has the ability to encroach rapidly into disturbed areas, particularly where the grass cover has been depleted by overgrazing. In some areas fairly large tracts of formerly open woodland have been transformed into dense thickets within relatively few years. Once established in thickets, D. cinerea is

difficult to eradicate by mechanical means because, even when the main stems are removed, many young plants usually regenerate from the rootlets remaining in the ground.

The wood of *D. cinerea* is very hard and durable and, being termite-resistant, is considered one of the best for use as fencing posts, if sufficiently straight enough lengths can be found. It is also excellent for fuel and for making charcoal.

When using the following key, the width of the largest leaflets must be used; if any leaflets are 2 mm or more wide the specimen should be referred to subsp. nyassana. It is likely that most specimens can be correctly placed, but intermediates occur between most of the taxa, and these may cause difficulty. In particular, it may be difficult to decide whether some specimens should be assigned to subsp. nyassana or to subsp. africana var. africana. Typical subsp. cinerea is confined to Asia.

Some or all leaflets 2 mm or more wide; leaves often large and up to 18 cm long, with pinnae up to 7,5 cm long; peduncles usually fascicled.....subsp. nyassana

All leaflets less than 2 mm wide; leaves smaller than above, pinnae usually less than 4 cm long; peduncles single or sometimes fascicled:

Surfaces of leaflets (apart from the ciliate margins) glabrous or sometimes with few hairs on the lower surface only:

Glands on leaf-rhachis stipitate or columnar, 0,5-2 mm tall, present at the junction of each pinna pair or absent from some (very rarely the gland between the lowest pair stipitate and glands between the remainder ±sessile); leaflets 0,6-1,75(2) mm wide.........................subsp. africana var. africana

Both surfaces of leaflets densely pubescentsubsp. africana var. pubescens

Maputa up to the Lebombos", Sim 6248 (whereabouts unknown). D. glomerata subsp. nyassana (Taub.) Brenan in Kew Bull. 11: 188 (1956). Type as for D. nyassana.

Young branchlets densely spreading-pubescent. Leaves often large and up to 18 cm long, with 6-11 pairs of pinnae which are up to 7,5 cm long; leaflets $5-12\times2-3$ mm, margins shortly ascending- to appressed-ciliate or subglabrous. Peduncles \pm densely spreading-pubescent, usually appearing fascicled. Pods 10-15 mm wide, loosely to tightly coiled.

Found in Zaire, Rwanda, Uganda, Tanzania, Angola, Zambia, Malawi, Rhodesia, Mozambique, the Transvaal, Swaziland and Natal. Appears to occur most commonly in woodland.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, Mabasa, Lang sub TRV 32192. 2330 (Tzaneen): southern bank of Mtataspruit, Westfalia Estate (—CA), Scheepers 50; New Agatha (—CC), McCallum 543. 2430 (Pilgrim's Rest): Shiluvane, Junod 691 (K). 2431 (Acornhoek): Bushbuck Ridge, Pritchard 34. 2528 (Pretoria): Wonderboompoort, Leendertz 609. 2530 (Lydenburg): Nelspruit (—BD), Rogers 4769; between White River and Nelspruit (—BD), Burtt Davy 1505; Waterval-Bo (—CB), Rogers 14874. 2531 (Komatipoort): Kruger National Park, 1, 6 km N. of Pretorius Kop (—AB), Codd 5192; Barberton (—CC), Pott 5306. NATAL.—2731 (Louwsburg): Ngotshe, Gerstner 2516 (NH). 2732 (Ubombo): Jozini, Ross 1127 (K, NH, NU). 2832 (Mtubatuba): Hluhluwe Game Reserve (—AA), Ross 942 (NH); Dukuduku (—AC), Strey 7336. 2930 (Pietermaritzburg): Shongweni Dam, Morris 570. 2931 (Stanger): New Guelderland (—AD), Stewart 132 (NH); Umhlanga (—CA), B. J. Huntley 75 (NH). Grid ref. unknown: Durban Flats, Wood 1449 (NH).

In its typical form in tropical Africa subsp. nyassana is distinct and easily recognized by its broad leaflets, large leaves and usually fascicled peduncles. However, in our area leaflet width, leaf size and the arrangement of the peduncles provide no discontinuity between subsp. nyassana and subsp. africana var. africana and some specimens from the eastern Transvaal, Swaziland and Natal are extremely difficult to place with certainty. Indeed, it is sometimes a matter of opinion whether they should be assigned to subsp. nyassana or to subsp. africana var. africana. The problem of differentiating depauperate specimens of subsp. nyassana and robust specimens of subsp. africana var. africana in our area is therefore a very real and difficult one. The decision to uphold subsp. nyassana was taken because over most of its range in tropical Africa it is a Edistinct taxon.

There is some evidence to suggest that subsp. nyassana has slightly different ecological preferences to subsp. africana in our area, but detailed field studies are required to substantiate this.

(b) subsp. africana Brenan & Brummitt in Bol. Soc. Brot., Sér. 2, 39: 77 (1965); Schreiber in F.S.W.A. 58: 15 (1967); Brenan & Brummitt in F.Z. 3,1: 42, t. 11 (1970). Type: Mozambique, Lourenzo Marques, Quinta do Umbeluzi, Gomes e Sousa 3466 (K, holo.!).

Young branchlets \pm densely pubescent to \pm glabrous. Leaves usually smaller than in subsp. *nyassana*, with 4-19 pairs of pinnae which are up to \pm 4 cm long; leaflets 2-7 \times (0,3)0,5-1,75(2) mm wide, margins strongly ciliate to sparsely appressed-ciliate or glabrous. Pods 6-15 mm wide, loosely to tightly coiled.

This subspecies occurs throughout most of tropical Africa from the Cape Verde Is., Senegal, Ethiopia southwards to South West Africa, Botswana, the Transvaal, Swaziland, Natal and the northern Cape Province, but absent from rain-forest regions; three varieties occur in our area.

(i) var. africana.

*Since Brenan & Brummitt's paper on Dichrostachys was published in 1965 important changes affecting autonyms (automatically established names) were introduced into Article 26 of the latest edition of the International Code of Botanical Nomenclature (1972). One of these changes is the rejection in certain circumstances of the previous ruling that autonyms must always be adopted for taxa which include the type of the correct name of the next higher taxon. In some instances this results in a name which was correct when published now being made retrospectively incorrect, and thus enforcing the adoption of another, often undesirable, name. Dichrostachys cinerea subsp. africana var. africana is such an example. Included in this variety was Cailliea dichrostachys Guill. & Perr. var. leptostachys (DC.) Guill. & Perr., so that the correct name for var. africana, which was itself correct under the Code when published, is now var. leptostachys under the new Code. This requires a new combination for var. leptostachys. However, as an attempt is to be made at the Leningrad Congress in 1975 to have the recent changes in the Code affecting autonyms reversed, it is considered undesirable to effect the new combination until the outcome of this attempt is known.

Subsp. africana var. africana grades into subsp. nyassana in our area and, as discussed under the latter, difficulty is sometimes experienced in deciding whether a specimen should be assigned to subsp. africana var. africana or to subsp. nyassana.

Subsp. africana var. africana, on the other hand, also grades into subsp. africana var. lugardiae (N.E. Br.) Brenan & Brummitt and into subsp. argillicola Brenan & Brummitt var. hirtipes Brenan & Brummitt in our area. There is continuous variation in leaflet width and other morphological characters between var. africana and var. lugardiae and depauperate specimens of var. africana tend to be confused with robust specimens of var. lugardiae. In view of this ± continuous variation, it is felt that little is to be gained by continuing to recognize both var. africana and var. lugardiae. Consequently var. lugardiae has been relegated to synonymy under var. africana.

In F.Z. 3, 1:38 (1970) subsp. argillicola var. hirtipes was distinguished from subsp. africana by having fewer pinnae pairs and narrower pods. In our area, however, specimens with few pinnae pairs which key out to subsp. argillicola var. hirtipes often have pods up to 1,1 cm wide so that pod width fails to provide a discontinuity between the two taxa. Although the pods on some specimens of subsp.

argillicola var. hirtipes are loosely coiled, on others the pods are strongly coiled and no distinction can be drawn between them and specimens of subsp. africana var. africana on the degree of coiling of the pods. The number of pinnae pairs likewise provide no discontinuity between the two taxa. As there do not appear to be any well-defined morphological, geographical or ecological discontinuities between var. africana and the specimens which key out to subsp. argillicola var. hirtipes in our area, the latter are also included in subsp. africana var. africana.

Two specimens collected near Ndumu in northern Tongaland on the border of Mozambique, namely, Strey & Moll 4014, 4020, fall within the limits of subsp. africana var. plurijuga Brenan & Brummitt. Although having slightly narrower leaflets than usual for var. africana, for the present these specimens are also included in var. africana.

Subsp. forbesii (Benth.) Brenan & Brummitt, with subglabrous to sparsely or densely puberulous peduncles and glabrous to sparsely appressed-puberulous young branchlets, was recorded from Natal by Brenan & Brummitt in Bol. Soc. Brot., Sér. 2,39 : 102 (1965) and in F.Z., l.c. : 40. The taxonomic significance of a \pm glabrous peduncle in our area is difficult to assess. There is a suggestion that the peduncles of flowering specimens on some plants are pubescent, while peduncles on fruiting specimens from the same plant are glabrescent or glabrous. It is unknown whether plants with glabrous peduncles have distinct ecological preferences, or whether they are merely variants within populations of plants with predominantly pubescent peduncles. As little is known about subsp. forbesii at present, the specimens in our area with \pm glabrous peduncles are, for the most part, included in var. africana.

Until the taxonomic significance of the differential characters employed to distinguish some of the taxa has been investigated in the field, the broad view of var. africana adopted here is preferred.

(ii) var. pubescens Brenan & Brummitt in Bol. Soc. Brot., Sér 2,39: 86 (1965), in F.Z. 3,1: 44, t. 10 fig. D (1970). Type: Mozambique, Gaza, Guijá, Aldeia da Barragem, Barbasa & Lemos 8149 (K, holo!; COI; LISC; LMJ).

Glands on leaf-rhachis stipitate or columnar, 0,5-2 mm tall, present at the junction of the basal pinna pair and up to 5 of the distal pairs of pinnae; both surfaces of leaflets densely pubescent.

Found in Rhodesia, Mozambique, the Transvaal and Swaziland.

TRANSVAAL.—2328 (Baltimore): Villa Nora, Acocks 8815; farm Kaalhoek, 192 km N. of Potgietersrust, Kinges 1335. 2531 (Komatipoort): Kaapmuiden, Rogers 25047.

SWAZILAND.—2631 (Mbabane): Ranches Irrigation Settlement, Compton 24669.

Apparently infrequent and irregular in its occurrence in our area.

(iii) var. setulosa (Welw. ex Oliv.) Brenan & Brummitt in Bol. Soc. Brot., Sér. 2,39:93 (1965); in F.Z. 3,1:45, t. 10 fig. E (1970). Type: Angola, near Lopolo, Welwitsch 1800 (BM, iso.!).

Dichrostachys nutans var. setulosa Welw. ex Oliv. in F.T.A. 2:333 (1871); Hiern, Cat. Afr. Pl. Welw. 1:308 (1896). D. glomerata sensu Fl. Pl. Afr. 23:t. 894 (1943), non (Forsk.) Chiov. sensu stricto. D. cinerea subsp. africana sensu Schreiber in F.S.W.A. 58:15 (1967) pro parte.

Acacia kalachariensis Schinz in Mém. Herb. Boiss. 1: 114 (1900). Type: Kalahari, without precise locality, Fleck 408a (Z, holo.!).

Glands on leaf-rhachis sessile or very shortly (to 0,3 mm) stipitate, present at the junction of all pairs of pinnae; leaflets 0,5-0,8 mm wide, usually strongly and densely ciliate, hairs sometimes also present on the lower surface only.

Found in Tanzania, Angola, South West Africa, Botswana, Rhodesia, the Transvaal and northern Cape Province. Appears to favour sandy soils.

S.W.A.—1718 (Kuring-Kuru): 14,8 km S.W. of Nzinzi down Omuramba Mpungu, De Winter 4003. 1719 (Runtu): Runtu, De Winter 3725; 17,6 km W. of Sambusu Mission Station, De Winter & Marais 4971. 1721 (Mbambi): Mbambi, 56 km W. of Andara, Le Roux 1067. 1813 (Ohopoho): 19,2 km S. of Ohopoho, De Winter & Leistner 5810. 1917 (Tsumeb): 17,5 km S W. of Otavi on road to Otjiwarongo, De Winter 2846. 1920 (Tsumkwe): Tsumkwe, Story 6443; Samangeigei [Tsammagaigai], Maguire 2091. Grid ref. unknown: 32 km S. of Osiri, Liebenberg 4684.

CAPE.—2525 (Mafeking): 16 km S.E. of Pitsani, Leistner 559. 2624 (Vryburg): Palmyra (—AC), Breuckner 1142; "Moshesh", near Mosito (—BB), Breuckner 259. 2723 (Kuruman): 33,6 km N.W. of Kuruman, Leistner 1062. Grid ref. unknown: Armadillo Creek, Vryburg District, Burtt Davy 13846.

The ± sessile glands on the leaf-rhachis at the junction of each pinna pair appear to be a fairly reliable diagnostic character. Var. setulosa, which has a similar facies to var. lugardiae (now included in var. africana), differs from the latter almost solely on the type of glands on the leaf-rhachis. In general little difficulty has been experienced in referring specimens to this taxon except in the central Transvaal where var. setulosa almost grades into var. africana. These problematical specimens have a stalked gland at the junction of the lowest pinna pair and ± sessile glands at the junction of all of the other pinnae pairs.

8. XEROCLADIA

Xerocladia Harv. in F.C. 2:278 (1862); Benth. & Hook.f., Gen. Pl. 1:591 (1865); Harv., Gen. Pl. ed.2:92 (1868); Benth. in Trans. Linn. Soc. Lond. 30:381 (1875); Taub. in Pflanzenfam. 3, 3:118 (1892); Harms in Engl., Pflanzenw. Afr. 3, 1:392 (1915); Bak.f., Leg. Trop. Afr. 3:806 (1930); Phill., Gen. 392 (1951); Hutch., Gen. Fl. Pl. 1:292 (1964); Schreiber in F.S.W.A. 58:19 (1967). Type species: X. viridiramis (Burch.) Taub.

Small rigid much-branched shrubs. Stipules spinescent, in pairs, short and recurved. Leaves bipinnate, small, with 1 pinna pair; pinnae each with 6-12 pairs of linear-oblong leaflets. Inflorescence capitate, solitary in the axils of the leaves. Flowers in globose heads, hermaphrodite, 5-merous. Calyx divided almost to the base. Petals free, except basally. Stamens 10, filaments linear, free, the 5 opposite the petals short, the 5 alternating with the petals longer but scarcely exceeding the petals; anthers small, with a minute deciduous gland apically. Ovary shortly stipitate. Pods sessile, broadly falcate-ovate or semi-orbicular, planocompressed, the lower suture arched and winged, 1-seeded, indehiscent. Seeds compressed, subcircular-elliptic, smooth.

An endemic monotypic genus recorded from Namaqualand and South West Africa.

The name Xerocladia is derived from the Greek words xeros and kladion, meaning dry and branch respectively.

Xerocladia viridiramis (Burch.) Taub. in Bot. Centr. 47: 395 (1891); Dinter in Deutsch-Sudwest-Afrika 78 (1909); Bak.f., Leg. Trop. Afr. 3: 806 (1930); Schreiber in F.S.W.A. 58: 19 (1967). Type: Cape, Carnarvon Distr., Karel Krieger's Grave, Burchell 1586 (K, holo.!).

Acacia viridiramis Burch., Trav. 1: 300 (1822); DC., Prodr. 2: 457 (1825); Harv. in F.C. 2: 284 (1862). Type as above.

Xerocladia zeyheri Harv. in F.C. 2: 278 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 381 (1875). Type: Cape, Calvinia Distr., Springbokkeel, Burke & Zeyher 558 (K, holo.!; P!; PRE!; TCD!).

Small rigid much-branched shrub up to 1 m high; branches often somewhat zigzag, pale green to olive, terete, cano-puberulous and substriate. Stipules spinescent, in pairs, recurved, reddish-brown, up to 3,5 mm long. Leaves bipinnate, small: petiole up to 3 mm cano-puberulous, with a stalked reddish-brown gland up to 1 mm high just below the point of attachment of the pinnae; rhachillae up to 1,5 cm long, glabrous to cano-puberulous; 1 pinna pair per leaf; leaslets in 6-12 subopposite pairs, up to $3(4) \times 1(1,3)$ mm, oblong or linear-oblong, obtuse or acute apically, sparingly to densely pubescent on the margins only or sometimes on the lower surface also, seldom glabrous throughout, usually with a small reddishbrown gland at the base of each leaflet. Inflorescences capitate, pedunculate, solitary in the axils of the leaves. Flowers hermaphrodite, 5-merous, sessile, in heads up to 7 mm in diameter; peduncles up to 8 mm long, cano-puberulous. Calyx divided almost to the base, segments 1-2 mm long, up to 1,2 mm wide, densely villous externally. Petals free except basally, up to 2,5(3) mm long, + 1 mm wide, linear-lanceolate to -oblong, glabrous. Stamens 10, filaments linear, free, the 5 opposite the petals short, the 5 alternating with the petals longer but scarcely exceeding the petals; anthers up to 0.8 mm long, with a minute deciduous apical gland. Ovary up to 2 mm long, 1,6 mm wide, shortly stipitate, densely villous; style glabrous; stigma truncate. Pods sessile, often clustered, chestnut- to reddish- or purplish-brown, up to 1,5 cm long and 1,5 cm broad, broadly falcate-ovate to semi-orbicular, compressed, the lower suture arched and winged, 1-seeded, indehiscent. Seeds chestnut-brown, compressed, up to $6,5 \times 5$ mm, subcircular-elliptic, smooth.

Found in South West Africa and Namaqualand. Occurs in sandy river beds, on river banks, alluvium and saline flats.

S.W.A.—2416 (Maltahöhe): Namseb (—DD), Pearson 9345 (K); Christiana farm (—DD), Steyn sub PRE 26458. 2417 (Mariental): farm Orab, Kinges 3428. 2517 (Gibeon): 4,8 km S. of Asab (—DB), Hardy 1946; farm Gavetamas (—DB), Giess, Volk & Bleissner 6854. 2618 (Keetmanshoop): 54,4 km E. of Keetmanshoop on road to Aroab, De Winter 3357. 2619 (Aroab): farm Gross Aub, Giess 8364.

CAPE.—3019 (Loeriesfontein): Springbokked, Burke & Zeyher 558, 3021 (Vanwyksvlei): Vanwyksvlei, Acocks 1749. 3022 (Carnarvon): Kleinfontein (—BC), Marloth 5069; Karel Krieger's Grave (—CA), Burchell 1586 (K). 3023 (Britstown): near Rosedale, Reyneke sub PRE 31901. Grid ref. unknown: Bushmanland, Marloth 8072.

X. viridiramis is a most distinctive and easily

recognized plant.

MIMOSOIDEAE 131

FIG. 17.—Xerocladia viridiramis. 1, flowering and fruiting branch, $\times \frac{2}{3}$; 2, flower, with one anther removed, \times 12; 3, ovary, \times 12; 4, fruit, \times 2, all from Acocks 1749.

9. AMBLYGONOCARPUS

Amblygonocarpus Harms in Engl. & Prantl, Nat. Pflanzenfam., Nachtrag 1: 191 (1897); Harms in Bot, Jahrb. 26: 255 (1899); Harms in Engl., Pflanzenw. Afr. 3, 1: 396 (1915); Bak, f., Leg. Trop. Afr. 3: 803 (1930); Gilbert & Boutique in F.C.B. 3: 217 (1952): Keav in F.W.T.A. ed. 2. 1:492 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 32 (1959); Hutch., Gen. Fl. Pl. 1: 290 (1964): Brenan & Brummitt in F.Z. 3, 1: 35 (1970). Type species: A. andongensis (Welw. ex Oliv.) Exell & Torre (A. schweinfurthii Harms).

Unarmed tree, glabrous. Leaves bipinnate, eglandular; pinnae 2-6 pairs; pinnae each with several pairs of alternate or sometimes subopposite leaflets. *Inflorescences* of solitary or paired axillary racemes. Flowers hermaphrodite, pedicellate. Calvx gamosepalous, very small, with 5 (rarely 6) teeth. Petals 5 (rarely 6), free. Stamens 10 (rarely 12), free, fertile; anthers eglandular apically even in bud. Pods straight or nearly so, oblong, woody, indehiscent, bluntly tetragonal or subterete in section, internally septate between the seeds, Seeds brown, smooth, hard, unwinged.

A monotypic genus occurring in tropical Africa.

Closely related to Tetrapleura Benth, but differs from this genus in having eglandular anthers and pods which are bluntly tetragonal or subterete in section, while the pods of Tetrapleura are cruciform in section owing to the presence of a thick wing-like projection running longitudinally along each of the valves. Immature pods of Amblygonocarpus may have four rather prominent ribs, simulating the shape in section of those of the genus Tetrapleura.

The generic name Amblygonocarpus is a Greek compound meaning "blunt-angled fruit"; in allusion to the pods of A. andongensis.

Amblygonocarpus andongensis (Welw. ex Oliv.) Exell & Torre in Bol. Soc. Brot., Sér. 2,29: 42 (1955); Torre in C.F.A. 2: 264 (1956); Keay in F.W.T.A. ed. 2, 1: 492 (1958); Brenan in F.T.E.A. Legum.-Mimos. : 34, fig. 9 (1959); F. White, For. Fl. N. Rhod. 90 (1962); Brenan & Brummitt in F.Z. 3.1 : 35, t. 8 (1970); Palmer & Pitman. Trees S. Afr. 2:823 (1973). Type: Angola. Cuanza Norte, Pungo Andongo, Welwitsch 618 (LISU, ? holo.; BM!; K!; P!).

Tetrapleura andongensis Welw. ex Oliv. in F.T.A. 2:331 (1871); Bak. f., Leg. Trop. Afr. 3:803 (1930). Type as above. T. obtusangula Welw. ex Oliv. in F.T.A. 2: 331 (1871). Type: Angola, Cuanza Norte, Golungo Alto, Welwitsch 1751 (BM, drawing!).

Amblygonocarpus schweinfurthii Harms in Bot. Jahrb. 26: 255 (1899); Harms in Engl. Pflanzenw. Afr. 3, 1: 396, t.277 (1915); Eyles in Trans. Roy. Soc. S. Afr. 5: 363 (1916); Bak. f., Leg. Trop. Afr. 3: 804 (1930). Syntypes: Sudan, Seriba Siber Ruchama, Schweinfurth ser. 11, 92 (Bt; BM!; K!); Seriba Agad, Schweinfurth 1692 (B †; BM!; K!); Angola, Malange, Marques 23 (B†). A. obtusangulus (Welw, ex Oliv.) Harms in Bot. Jahrb. 26: 256 (1899); Bak. f., Leg. Trop. Afr. 3: 804 (1930); Brenan, Checklist Tang. Terr. 343 (1949); Gilbert & Boutique in F.C.B. 3:217 (1952); O. B. Miller in J.S. Afr. Bot. 18: 28 (1952); Gomes e Sousa, Dendrol. Moçamb. Estudo Geral. 1: 226, t. 31 (1966). Type as for Tetrapleura obtusangula.

Unarmed tree up to 15 m high, glabrous throughout; bark greyish-brown to black. fissured, reticulate or scaly. Leaves bipinnate, eglandular: petiole 4-7,5 cm long; rhachis 2–15 cm long; pinnae 2–5 opposite or subopposite pairs; rhachillae 6,5-15 cm long; leaflets 5-9 on each side of the rhachilla, alternate or sometimes subopposite, 1,2- $2.5 \times 0.7-1.5$ cm, elliptic to obovateelliptic, usually emarginate apically, on petiolules 1,5-3 mm long. Racemes (3)6-12 cm long, on peduncles 1-3 cm long, axillary. Flowers yellowish-white, on pedicels 1,5-3,5 mm long. Calyx cupular, very small, 0,5-1 mm long, usually 5-toothed. Petals free, $3-4 \times 0,8-1$ mm. Stamens usually 10, filaments 5-6 mm long; anthers eglandular. Ovary up to 2,5 mm long, very shortly stipitate. Pods $8-17 \times 1,8-3$ cm, straight or nearly so, bluntly tetragonal or subterete in section, brown, glossy, woody, indehiscent, rounded or pointed apically. Seeds elliptic, $10-13 \times 7-8 \times 4-5$ mm.

Widely distributed in the savanna regions of tropical Africa from Ghana to the Sudan, and southwards to the Caprivi Strip, Botswana, Rhodesia and Mozambique. Occurs in deciduous woodland.

S.W.A.—1724 (Katima Mulilo): Katima Mulilo, West 3252. Grid ref. uncertain: Caprivi Strip, E. of Cuando River, Curson 974.

More material of this species from our area is required.

10. NEWTONIA

Newtonia Baill. in Bull. Soc. Linn. Par. 1:721 (1888); Brenan in Kew Bull. 10:180 (1955); in F.T.E.A. Legum.-Mimos.: 23 (1959); Hutch., Gen. Fl. Pl. 1:286 (1964); Brenan & Brummitt in F.Z. 3, 1:28 (1970). Type species: N. duparquetiana (Baill.) Keay (N. insignis Baill.).

Unarmed trees. Leaves bipinnate; rhachis usually with a gland between each pair of opposite pinnae; pinnae each with one to many pairs of leaflets. Flowers sessile or nearly so, in spikes or spiciform racemes, hermaphrodite, 5-merous. Calyx gamosepalous, pubescent or puberulous outside, sometimes on the margins only. Petals free, separated from the gynophore base by a short perigynous zone, pubescent or puberulous outside, sometimes on the margins only. Stamens 10, fertile; anthers with or without an apical gland. Ovary densely pilose outside. Pods straight or somewhat curved, flattened, at maturity dehiscing along one of the margins, the valves remaining attached along the other, splitting neither transversely nor into layers. Seeds flattened, oblong, surrounded by a membranous wing, much elongated lengthwise in the direction of the pod; cotyledons elongate in the same direction as the radicle; funicle slender, attached at or near one end of the seed.

A genus of 14 or more species, 11 of them over much of tropical Africa, the rest in tropical S. America. One species found in southern Africa.

The genus was named in honour of Sir Isaac Newton.

Newtonia hildebrandtii (Vatke) Torre in Mendonca, Contr. Conhec. Fl. Mocamb. 2:89 (1954); Brenan in Kew Bull. 10:181 (1955); in F.T.E.A. Legum.-Mimos.: 25 (1959); Dale & Greenway, Kenya Trees & Shrubs 305 (1961); F. White, For. Fl. N. Rhod. 433 (1962); Brenan. & Brummitti in F.Z. 3,1:30 (1970); Van Wyk, Trees Kruger Nat. Park 1:176 (1972); Palmer & Pitman, Trees S. Afr. 2:819 (1973). Type: Kenya, Teita District, Ndi, Hildebrandt 2492 (B, holo. †; BM!; K!).

Piptadenia hildebrandtii Vatke in Oest. Bot. Zeitschr. 30: 273 (1880); Eyles in Trans. Roy. Soc. S. Afr. 5: 364 (1916); Bak. f., Leg. Trop. Afr. 3: 793 (1930); Brenan, Checklist Tang. Terr. 346 (1949). Type as

var. hildebrandtii.

Brenan in Kew Bull. 10: 181 (1955); in F.T.E.A. Legum.-Mimos.: 25 (1959); Brenan & Brummitt in F.Z. 3,1: 30 (1970); Ross, Fl. Natal 194 (1973).

Piptadenia sp. sensu Henkel, Woody Pl. Natal 237

(1934).

Tree up to 18 m high with a large, often rounded, crown; bark dark brown to greyish, rough or sometimes smooth; branchlets puberulous to shortly pubescent when young. Leaves puberulous to shortly pubescent: petiole 0,5-1,3 cm long; rhachis 2-4,5 cm long, with a sessile usually cylindrical gland between each pinna pair; pinnae (2)4-5(7) pairs; rhachillae 1,8-4,5 cm long; leaflets (8)10-19(22) pairs, 4-9,5 × 1-2 mm, ± linear-oblong or oblong, glabrous apart from the marginal cilia or sometimes sparingly pubescent on the lower surface, sometimes

glabrous throughout. Inflorescences spicate; spikes 3-10 cm long; inflorescence axes puberulous with small ± appressed hairs or hairs short and spreading. Flowers pale yellowish-white, subsessile. Calyx cupular, up to 1,2 mm long, 5-toothed, puberulous. Petals 5, free, up to 3.2×0.9 mm, glabrous or sometimes sparingly pubescent apically. Stamens 10, free .up to 5 mm long; anthers without an apical gland. Ovary up to 1,8 mm long, stipitate, densely pilose. Pods bright red when young, becoming brown with age, $8-20 \times 1.3-2$ cm, straight or somewhat curved, linear-oblong, flattened, dehiscing along one of the margins, the valves remaining attached along the other. Seeds flattened, oblong, surrounded by a membranous wing, $2.8-4 \times 1.2-2$ cm.

Found in Kenya, Tanzania, Zambia, Rhodesia, Mozambique and Natal (Tongaland). Occurs on sandy soils.

NATAL.—2632 (Bela Vista): Ndumu Game Reserve, Moll 1754; Ndumu Game Reserve, southern shore of Nyamiti Pan, Ross 2433. 2732 (Ubombo): 1,6 km E. of Makanes Pont (—AB), Ross 1967; 2,4 km E. of Makanes Pont (—AB), Edwards 2986; Mkuzi Game Reserve (—CB), Ward 4559; False Bay Park (—CD), Strey 7344.

Var, hildebrandtii occurs on the sandy soils of the Tongaland plain at altitudes below 130 m. One of the dominant species in the dry sand forest, more infrequently growing near water, for example, on the southern shore of the Nyamiti Pan in the Ndumu Game Reserve. The Tonga name for this species is umFomothi.

Var. pubescens Brenan, which is recorded from Tanzania, Rhodesia and Mozambique, differs from var. hildebrandtii in having the leaflets±densely pubescent or puberulous on both surfaces.

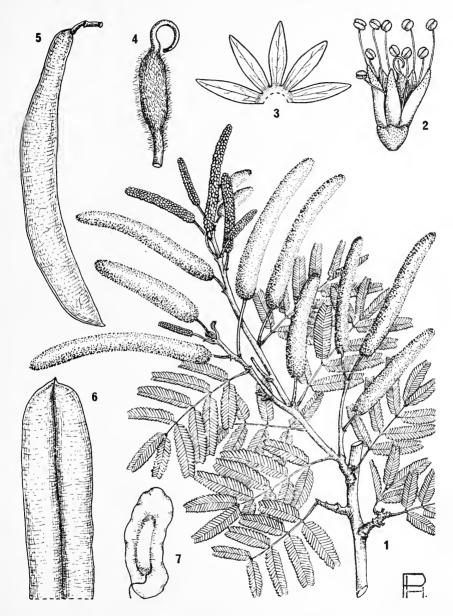

FIG. 19.—Newtonia hildebrandtii. 1, flowering branch, \times \(\frac{2}{3}, Ross 1967; 2, flower, \times 6; 3, corolla, opened out, \times 6; 4, gynoecium, \times 12, all from Ward 2094; 5, pod, \times \(\frac{2}{3}; 6, \) dehisced pod showing the valves still attached along one margin, \(\times \frac{2}{3}; 7, \text{seed}, \times 1, \text{all from Moll 1754.} \)

MIMOSOIDEAE

11. XYLIA

Xylia Benth. in Hook., J. Bot. 4: 417 (1842); Benth. & Hook.f., Gen. Pl. 1: 594 (1865); Benth, in Trans. Linn. Soc. Lond. 30: 373 (1875); Taub. in Pflanzenfam. 3, 3: 121 (1892); Harms in Engl., Pflanzenw. Afr. 3, 1: 404 (1915); Bak. f., Leg. Trop. Afr. 3: 809 (1930); Gilbert & Boutique in F.C.B. 3: 210 (1952); Keay in F.W.T.A. ed. 2, 1: 495 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 29 (1959); Hutch., Gen. Fl. Pl. 1: 291 (1964); Brenan & Brummitt in F.Z. 3. 1:33 (1970). Type species: X. xylocarpa (Roxb.) Taub. (X. dolabriformis Benth.).

Unarmed trees, Leaves bipinnate: petiole bearing a gland at its apex at the junction of the solitary pair of pinnae; pinnae each with few to many pairs of leaflets. Inflorescences capitate, pedunculate, axillary or supra-axillary, solitary or paired or sometimes in threes, sometimes \pm racemosely aggregated on short shoots. Flowers in round heads, male or hermaphrodite, 5-merous, sessile or pedicellate. Calyx gamosepalous, with 5-lobes. Corolla with 5 lobes \pm united below, ± pubescent or puberulous outside. Stamens 10, fertile; anthers each with a caducous apical gland (rarely and only in extra-African species absent). Ovary pubescent. *Pods* usually obliquely obovate to oblance olate or dolabriform, woody, compressed, dehiscing from the apex downwards into 2 recurving valves. Seeds lying transversely or obliquely in the pod, each sunk in a depression in the valve, usually brown, smooth, compressed, exendo-

A genus of ± 13 species in the tropics of the Old World, mostly in Africa and in Madagascar. One species

occurs in southern Africa.

The generic name Xylia is derived from the Greek word for wood; in allusion to the hard wood or perhaps to the woody pods of the species of this genus.

Xylia torreana Brenan in Kew Bull. 12: 359 (1958); Von Breitenbach, Indig. Trees S.Afr. 2: 313 (1965); Gomes e Sousa, Dendrol. Mocamb. 1: 228, t.33 (1966); Brenan & Brummitt in F.Z. 3,1:35, t.7 (1970); Van Wyk, Trees Kruger Nat. Park 1: 178 (1972); Palmer & Pitman, Trees S.Afr. 2: 823 (1973). Type: Mozambique, Maringua's village, 10 km N. of River Save, Chase 2244 (K, holo.!; BM!; LISC; SRGH). Xvlia africana sensu Torre in Mendonça, Contr.

Conhec. Fl. Moçamb. 2:93 (1954),

Tree up to 15 m high, with rough dark brown to grey bark; branchlets, petioles, leaf-rhachillae and peduncles sparingly to densely brown-pubescent or tomentellous. Leaves: petiole 2-7 cm long, with a gland just below the junction of the solitary pair of pinnae; rhachillae 5-16 cm long, often with a gland just below the junction of some of the pairs of leaflets; leaflets 4-6 pairs, (3,5)4-7,5 (12) \times 2-4,2(6) cm, narrowly ovate of rarely narrowly elliptic, rounded or slightly cordate basally, tomentose on both surfaces when young, the upper becoming glabrous, the lower remaining ± densely pubescent at maturity, especially on the midrib and veins. Stipules linear, up to 1 cm long, deciduous. Flowers yellow, in heads up to 1,8 cm in diameter, on axillary peduncles 2-3,5 cm long; pedicels up to 1,5 mm long, densely

appressed-pubescent with the hairs longer and denser than on the calyx; interfloral bracts spathulate, 2-3 mm long. Calyx tubular-campanulate, up to 4,5 mm long, lobes up to 1,5 mm long, appressed-pubescent. Corolla up to 6 mm long, lobes up to $2,25 \times 0,75$ mm, appressed-pubescent. Stamens 10, filaments free, up to 1 cm long; anthers up to 0.6 mm long, each with a caducous apical gland. Ovary up to 3 mm long, 1,5 mm wide, pubescent; style glabrous, up to 8 mm long; stigma terminal. Pods obliquely obovate to oblanceolate, 9-12 \times 3,2-5 cm, woody, compressed, browntomentellous at least in part, dehiscing from the apex downwards, the 2 valves recurving. Seeds lying transversely or obliquely in the pod, each sunk in a depression in the valve, compressed, brown, $\pm 1.2 \times 0.9$ cm, smooth; areole \pm 6 \times 4 mm.

Found in Rhodesia, Malawi, Mozambique and the north-eastern Transvaal. Occurs in deciduous

woodland and, in our area, in sandveld.

TRANSVAAL.—2231 (Pafuri): Kruger National Park, Nwambiya, Van der Schijff & Marais 3678; Van der Schijff 5689; S.E. of Klopperfontein on Portuguese border, Van der Schijff 2907.

As no flowering specimens of X. torreana have

been collected in our area, the description of the flowers has been drawn up from material collected outside of our area. More material of X. torreana, particularly flowering material, is required from our MIMOSOIDEAE 137

FIG. 20.—Xylia torreana. 1, sterile branch, × \(\frac{1}{3}\), Torre 2721; 2, flowering branch, × \(\frac{1}{3}\); 3, bract, × 8; 4, flower, × 4; 5, corolla, × 4; 6, anther, × 14; 7, ovary, × 4; 8, pod, × \(\frac{1}{3}\), all from Dawe 463. 12. ELEPHANTORRHIZA

Elephantorrhiza Benth. in Hook., J. Bot. 4: 344 (1841); Harv. in F.C. 2: 277 (1862); Benth. & Hook.f., Gen. Pl. 1: 590 (1865); Harv., Gen. Pl., ed. 2: 91 (1868); Benth. in Trans. Linn. Soc. Lond. 30: 365 (1875); Taub. in Pflanzenfam. 3, 3: 122 (1892); Sim, For. Fl. Cape Col. 209 (1907); Harms in Engl., Pflanzenw. Afr. 3, 1: 398 (1915); Phillips in Bothalia 1: 187 (1923); Bak.f., Leg. Trop. Afr. 3: 800 (1930); Burtt Davy, Fl. Transv. 2: 331 (1932); Phill., Gen. 392 (1951); Torre in C.F.A. 2: 263 (1956); Brenan in F.T.E.A. Legum.—Mimos.: 19 (1959); Hutch., Gen. Fl. Pl. 1: 288 (1964); Schreiber in F.S.W.A. 58: 16 (1967); Brenan & Brummitt in F.Z. 3, 1: 23 (1970); Ross in Bothalia 11: 247 (1974). Type species: E. elephantina (Burch.) Skeels (E. burchellii Benth.).

Prosopis sensu E. Mey., Comm. 1:165 (1836); Eckl. & Zeyh., Enum. 259 (1836), non Prosopis L., Mant. 1:10 (1767).

Unarmed small trees, shrubs or suffrutices, often with a greatly enlarged underground rootstock or a number of rootstocks. Leaves bipinnate; petioles eglandular; pinnae 3-42 pairs; pinnae each with many pairs of leaflets. Inflorescences of spiciform racemes which are axillary, solitary or fascicled, often \pm aggregated. Flowers normally hermaphrodite, 5-merous, usually pale yellowish-white, on pedicels 1-2 mm long. Calyx gamosepalous, small, 1-2,5 mm long, 5-toothed. Petals 5, free or shortly united basally. Stamens 10, fertile; filaments 4-7,5 mm long, free among themselves, slightly adnate to the corolla basally; anthers with a usually rapidly deciduous apical gland. Ovary usually sessile, glabrous; style filiform; stigma terminal. Pods straight or somewhat curved, not spirally twisted, often large and up to 45 cm long, somewhat compressed, without transverse septa within; at maturity the valves separating from the persistent margins, but not splitting transversely into segments; the outer layer (exocarp) of the pod-wall often peeling off the inner layer (endocarp), the layers remaining intact or breaking up irregularly. Seeds often \pm compressed.

A genus of 9 species restricted to Africa south of the equator.

The generic name *Elephantorrhiza* is a Greek compound meaning "elephant root"; in allusion to the large roots of *E. elephantina*.

The underground root systems of each species need to be investigated as they may provide useful additional means of distinguishing some of the species. For example, there is a suggestion that *E. obliqua* and *E. elephantina* have different root systems, but field observations are necessary to substantiate this.

In keying out species of *Elephantorrhiza*, emphasis is usually laid on the habit of the plants, that is, whether the plants are suffrulices with unbranched aerial stems or whether they are shrubs or small trees with branched aerial stems. This is the character employed in the first dichotomy of the key and, as far as it is known, it is a fairly reliable character. However, *E. elephantina*, which Typically has unbranched aerial stems, may prove an exception when the growing apex has been damaged because then the stems sometimes develop lateral branches.

Suffrutex with unbranched (unless damaged) annual aerial stems up to 0,75(1) m high:

Pinnae (1)2-6 pairs per leaf; leaflets 4-13(21) pairs per pinna, 2-6,5 mm wide, ovate to ovate-oblong, very oblique basally, midrib starting in the distal corner of the leaflet-base and gradually becoming ± central in the leaflet, lateral nerves and veins usually prominent; confined to the Transvaal. 1. E. obliqua Pinnae (2)8-17 pairs per leaf; leaflets (7)12-45(55) pairs per pinna, 0, 5-2(2,5) mm wide, linear to linear-oblong, rarely narrowly oblanceolate, asymmetric basally; widespread.............2. E. elephantina

Shrub or small tree with woody branched aerial stems up to 7 m high, very rarely a suffrutex with branched procumbent stems:

Leaflets only slightly asymmetric basally, with the proximal side cuneate to slightly rounded, 1,5-3,5(4,5) mm wide; leaves with (1)4-8(9) pairs of pinnae.................4. E. burkei

Leaflets ± strongly asymmetric basally, with the proximal side broadly rounded-truncate to almost auriculate and the distal side cuneate; leaves with 2-41 pairs of pinnae:

Pinnae (2)6-14 pairs per leaf; calyx up to 1,5 mm long; pods 3-3,9 cm wide....8. E. schinziana Pinnae 3-7(9) pairs per leaf; calyx 2-2,25 mm long; pods 2-2,5 cm wide.....7. E. rangei

1. Elephantorrhiza obliqua Burtt Davy in Kew Bull. 1921: 191 (1921); Phillips in Bothalia 1: 189 (1923); Burtt Davy, Fl. Transv. 2: 332 (1932) pro parte excl. specim. Rogers 22011; Ross in Bothalia 11: 248 (1974). Type: Transvaal, between Carolina and Oshoek, at an outspan ± 1,6 km from Robinson's, Burtt Davy 2976 (BM, holo.!; FHO!; K!).

Suffrutex producing at ground level annual herbaceous stems up to 30 cm high from a number of underground rhizomes; aerial stems unbranched (rarely branched after damage to the main apex), longitudinally striate, pubescent or glabrous. Leaves pubescent or glabrous: petiole 2-6 cm long; rhachis (0)1,5-9 cm long; pinnae (1)2-6 pairs; rhachillae 2-11 cm long; leaflets 4-13(21) pairs per pinna, $5,5-15 \times 2-6,5$ mm, very oblique, ovate to ovate-oblong, broadly truncate basally, asymmetric and attached by one corner, midrib starting in the distal corner of the leaflet-base and gradually becoming almost central in the leaflet, usually with 2-3 other prominent veins arising from the leaflet-base, midrib and lateral nerves prominent above and below, acute or distinctly mucronate apically, glabrous or sparingly pubescent on the margins. Racemes axillary, often solitary, on the lower or the apical part of the stem, 3,5-6 cm long (including the peduncle), glabrous or very sparingly pubescent. Flowers yellowish-white, on pedicels up to 1,5 mm long, with minute reddish glands at the base of the pedicels. Calyx campanulate, up to 2 mm long, shortly 5-toothed, glabrous. Petals shortly united below, up to 4,5 mm long, 1 mm wide, linear-oblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla

basally; filaments up to 7,5 mm long; anthers up to 0,8 mm long, with a deciduous apical gland. Ovary up to 2 mm long, glabrous, sessile. Pod (only one collected) dark purplish-brown, 11×4 cm, straight, compressed, prominently transversely venose.

Apparently confined to the Transvaal. Occurs in grassland.

E. obliqua is readily distinguished from all other species by its large ovate leaflets with prominent venation. E. obliqua appears to have a different underground root system to E. elephantina, but field observations are required to substantiate this.

Stems pubescent; petioles, rhachides and rhachillae sparingly pubescent......(a) var. obliqua

Stems glabrous; petioles, rhachides and rhachillae glabrous......(b) var. glabra

(a) var. obliqua.

Phillips in Bothalia 1: 189 (1923); Burtt Davy, Fl. Transv. 2: 332 (1932) pro parte excl. specim. *Rogers* 22011; Ross in Bothalia 1.c.: 248. Type as above.

TRANSVAAL.—2630 (Carolina): between Carolina and Oshoek, at an outspan \pm 1,6 km from Robinson's farm, Burtt Davy 2976 (BM, FHO, K); Billy's Vlei, Lake Chrissie, Pole Evans sub PRE 13185.

More material of *E. obliqua*, particularly fruiting material, is required.

Rogers 22011 from the Pietersburg District of the Transvaal, cited under E. obliqua var. obliqua by Burtt Davy l.c.: 332 (1932), is in fact Dichrostachys cinerea (L.) Wight & Arn. subsp. nyassana (Taub.) Brenan.

(b) var. glabra Phillips in Bothalia 1:189, t.5 fig. 1 (1923); Burtt Davy, Fl. Transv. 2:332 (1932); Ross in Bothalia 1.c.: 249. Syntypes: Transvaal, Middelburg Distr., Botsabelo, Eiselen sub PRE 1229 (GRA!; K!; PRE!); Middelburg, Jenkins sub TRV 9128 (PRE!).

E. transvaalensis Phillips ined.

TRANSVAAL.—2529 (Witbank): 8 km N. of Middelburg, Aasvoegelskop (—CB), *Dyer 3934* (PRE); Doornkop (—CB), *Du Plessis 1074* (PRE); near Middelburg (—CD), *Gower s.n.* (PRE).

Codd 10119 from Bellevue farm near Twenty-four Rivers in the Waterberg District of the Transvaal resembles $E.\ obliqua$. The stem, petioles, rhachides and rhachillae are glabrous or almost so, and the leaves have up to 6 pinnae pairs and up to 19 pairs of leaflets per pinna. The leaflets are 9–18 \times 3–4 mm, \pm oblong, oblique basally, with an excentric midrib and two other prominent veins arising from the leaflet-base, conspicuously venose and distinctly mucronate apically. Although leaflet shape differs somewhat from the leaflet shape of the syntypes, Codd 10119 is closer to $E.\ obliqua$ than to any of the other species and, for the present, is referred to $E.\ obliqua$ var. glabra. Unfortunately Codd 10119 is sterile. Further collections are required to indicate whether or not Codd 10119 falls within the range of variation of $E.\ obliqua$.

2. Elephantorrhiza elephantina (Burch.) Skeels in U.S. Dept. Agric. Bur. Pl. Ind. Bull. 176: 29 (1910); Bak.f., Leg. Trop. Afr. 3: 800 (1930); Burtt Davy, Fl. Transv. 2: 332 (1932); O.B. Miller in J. Suffrutex producing at ground level annual stems 20-90 cm high from the woody end of a + elongate rhizome; aerial stems unbranched except for inflorescences (rarely branched after damage to the main apex); young stems glabrous or rarely pubescent. Leaves glabrous or sparingly pubescent: petiole 1,3-3,6(8) cm long; rhachis 3,5-13,5(17,5) cm long; pinnae 2-4 pairs in lower leaves, increasing to 7-17 opposite or subopposite pairs in upper leaves; rhachillae 3-9(10,5) cm long; leaflets (7)12-45(55) pairs per pinna, (4)5-10(15) \times (0,3)0,5-2(2,5) mm, linear to linear-oblong, rarely narrowly oblanceolate, glabrous or almost so, base nearly always asymmetric, with the proximal side rounded to cuneate, apex symmetric to asymmetric, acute, usually mucronate or rarely obtuse, lateral nerves and veins prominent or not. Racemes usually confined to the lower part of the stem, axillary, solitary or clustered, (2)3,5-8(12) cm long (including the peduncle), glabrous or very rarely pubescent. Flowers yellowishwhite, on pedicels up to 1,5 mm long, pedicels articulated near the middle, with minute reddish or reddish-brown glands at the base of the pedicels. Calyx shortly campanulate, up to 1,75 mm long, 5toothed, glabrous. Petals free or slightly connate basally, 2,75-3,75 mm long, up to 1 mm wide, linear-oblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 6,5 mm long; anthers up to 1 mm long, with a deciduous apical gland. Ovary up to 1,75 mm long, linear, shortly stipitate, glabrous. Pods dark brown or reddish-brown, $(5)9,5-15(21) \times$ 3-5,7 cm, straight or slightly curved, oblong, compressed, usually prominently transversely venose, often umbonate over the seeds, at maturity the valves separating from the persistent margins, the outer layer of the pod-wall peeling off the inner layer, the layers usually breaking up irregularly. Seeds $18-26 \times 13-18 \times 6-13$ mm, \pm ellipsoid.

Found in South West Africa, Botswana, Rhodesia, Mozambique, the Transvaal, Orange Frestate, Swaziland, Natal, Lesotho and Cape Province. Occurs in grassland and open scrub; often gregarious.

E. elephantina, commonly known as "Elands ', is the commonest and most widespread species. E. elephantina shows considerable variation in the number of pinnae pairs and in the number, size and shape of the leaflets. This variation appears to be to some extent geographical. There is a tendency for specimens from South West Africa, Botswana, the western portion of Rhodesia, the western Transvaal, Orange Free State and northern Cape to have leaves with fewer than 10 pinnae pairs, fewer than 26 leaflet pairs per pinna and leaflets more than 8×1 mm. The leaflets in these areas are frequently glaucous and the midrib is close to the distal margin basally but gradually becomes ± centric so that the leaflets are ± symmetric apically. In the eastern areas of Rhodesia, Mozambique, the eastern Transvaal, Swaziland and Natal there is a tendency for specimens to have leaves with more than 10 pinnae pairs, more than 26 leaflet pairs per pinna and leaflets less than 8 mm long and 1 mm wide. The midrib in these specimens is very close to the distal margin of the leaflets throughout their length as in E. suffruticosa and the leaflets are asymmetric apically. The Pretoria District of the Transvaal appears to be a critical area for to the west the leaves tend to have fewer than 10 pinnae pairs and fewer pairs of large leaflets, while to the east the leaves tend to have more than 10 pinnae pairs and more numerous pairs of smaller leaflets. The extremes, for example Seydel 3761 from Oas in South West Africa and Wood 634 from Inanda in Natal, look very different but as there is ± continuous variation throughout and the individual characters often vary independently no means has been found of satisfactorily delimiting the two groups.

The thick red underground rootstocks were at one time used for tanning and dyeing. Burtt Davy, Fl. Transv. 2: 332 (1932), reports having dug up a rootstock ± 8 metres long at Vereeniging.

Although the exocarp of the ripe pod is fairly hard, it readily absorbs water and soon starts to disintegrate. Seeds often germinate within the moist disintegrating pods on the surface of the soil. The interesting and unusual type of germination of the seeds of *E. elephantina* is discussed by Hofmeyer in S. Afr. J. Nat. Hist. 3: 215 (1921) and by Van der Schijff and Snyman in J. Arn. Arb. 51: 114 (1970).

3. Elephantorrhiza woodii Phillips in Bothalia 1: 193, t.5 fig. 6 (1923); Ross, Fl. Natal 194 (1973); in Bothalia 11: 250 (1974). Type: Natal, Klip River Distr., Pieters, near Colenso, Wood 7958 (NH, holo.!; PRE!).

Suffrutex (but see below) producing at ground level annual procumbent branched stems up to 60 cm long from an elongate rhizome; aerial stems longitudinally striate, glabrous to densely puberulous. Leaves glabrous to densely puberulous: petiole 0,8-1,6 cm long; rhachis (1)3,5-8,5(13)cm long, distinctly sulcate above; pinnae (2)5-10 opposite or subopposite pairs; rhachillae 1,8-6 cm long; leaflets 12-28 pairs per pinna, $2,5-6(9)\times 1-1,8(2,25)$ mm, linear to linear-oblong, glabrous, asymmetric basally, midrib starting in the distal corner of the leaflet-base and gradually becoming almost central in the leaflet, proximal side of base rounded, apex symmetric or asymmetric, acute or obtuse, mucronate, midrib prominent or not, lateral veins indistinct. Racemes axillary, usually solitary, 4,5-9,5 cm long (including the peduncle), glabrous to densely puberulous. Flowers yellowish-white. on pedicels up to 1,25 mm long, pedicels articulated near the middle, with minute glands at the base of the pedicels. Calyx up to 1,5 mm long, shortly 5-toothed, glabrous. 142

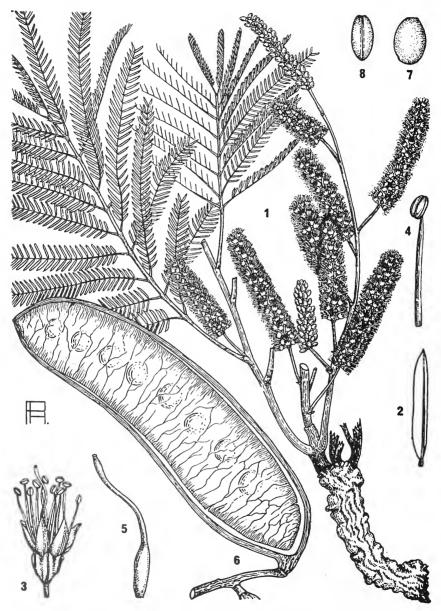

FIG. 21.—Elephantorrhiza elephantina. 1, flowering stems arising from part of the underground rhizome, × \(\frac{2}{3}\), \(Seydel \) 2388; 2, leaflet, × 4; 3, flower, × 4; 4, stamen, × 6; 5, gynoecium, × 6, all from \(Marsh \) 96; 6, pod, × \(\frac{2}{3}\); 7, seed, × \(\frac{2}{3}\); 8, seed, in profile, × \(\frac{2}{3}\), all from \(Nation \) 225.

Petals free or slightly connate basally, up to 3,25 mm long, 1,25 mm wide, lanceolate, slightly inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 6 mm long; anthers up to 1 mm long, with a deciduous apical gland. Ovary up to 2 mm long, linear, subsessile, glabrous. Pod (only one ever collected) dark reddish-brown, $9 \times 3,2$ cm, falcate, compressed, prominently transversely venose, umbonate over the seeds. Seeds immature.

Found in Natal and Lesotho. Occurs in grassland. Phillips, in Bothalia 1: 189 (1923), keyed out E. woodii under the species which are "shrubs or small trees with a distinct aerial stem." As there is no information about the habit of the plants in Medley Wood's collectors book or on the herbarium sheets, it is thought that Phillips assumed E. woodii was a shrub or small tree because the aerial stems are branched. During recent years several attempts have been made to re-collect *E. woodii* in the type locality and eventually, in 1970, Mr R. G. Strey succeeded in finding a few plants. However, the plants were procumbent and not shrubby or arborescent as indicated by Phillips. The habit notes in the above description are based on the specimens collected by Mr. Strey and subsequently cultivated at the Natal Herbarium, Durban. Each year the branched procumbent aerial stems die back and are replaced by a new set of stems the following season. The stems are relatively weak and show no signs of assuming an erect posture. More field observations are required to establish whether E. woodii ever does grow as an erect shrub. At the time of collecting the living plants, concern was expressed for the future of the species in the type locality, at least, because the plants only survive in the narrow strips of uncultivated land which may themselves be cultivated at any time.

E. woodii is closely related to E. elephantina but differs in having branched procumbent aerial stems and leaflets with a slightly different venation. It differs from all of the other species with branched stems in that the stems are procumbent and longitudinally striate.

Stems glabrous or almost so; petioles, rhachides and rhachillae glabrous or almost so; inflorescence axes ± glabrous.....(a) var. woodii

Stems pubescent; petioles, rhachides and rhachillae pubescent; inflorescence axes pubescent
......(b) var. pubescens

Unfortunately not enough material is available to evaluate the taxonomic significance of the degree of pubescence of the stems, leaves and inflorescence axes as a means of distinguishing varieties within this species.

(a) var. woodii.

Phillips in Bothalia 1:193 (1923); Ross, Fl. Natal 194 (1973); in Bothalia 1.c.: 251 (1974). Type as above.

NATAL.—2829 (Harrismith): Pieters (—DB), Strey 9760; Harts Hill, near Colenso (—DB), Strey 10000; Ladysmith (—DB), Geekie 46 (NU).

More material of var. woodii is required.

The following note written by Phillips on Wood 7958 (NH) indicates that he had initially intended calling this specimen E. waltbergii (Harv.) Phillips: "This is undoubtedly the plant described by Harvey as Entada ?wal.lbergii in Fl. Cap. 2: 277. I propose the new combination Elephantorrhiza wahlbergii, Phill. 8/6/19."

(b) var. pubescens Phillips in Bothalia 1: 193 (1923); Ross, Fl. Natal 194 (1973); in Bothalia 1.c.: 251 (1974). Type: Natal, Estcourt District, near Little Tugela, 1219 metres, Wood 2867 (NH, holo.).

E. pubescens Phillips ined.

NATAL.—probably 2929 (Underberg): near Little Tugela, Wood 2867 (NH). Grid ref. unknown: between Pietermaritzburg and Newcastle, Nov. 1883, Wilms 1973 (BM).

?LESOTHO.—no precise locality, Cooper 2279 (K).

Wilms 1973 (BM), collected between Pieter-maritzburg and Newcastle in 1883, appears to be referable to E. woodii var. pubescens. However, the specimen has wider leaflets and a somewhat different facies to typical var. pubescens. More material is desirable but, as the specimen was not well localised, there seems little likelihood of further material being collected.

Cooper 2279, a flowering specimen with immature leaves, also appears to be referable to var. pubescens. Although Cooper gave the locality of collection as "Basutoland", it is very doubtful whether the specimen was collected in present-day Lesotho.

Mogg sub PRE 9644, an immature and rather fragmentary specimen from Charlestown in northern Natal, is extremely difficult to place with certainty. The specimen in the Kew Herbarium consists of a single stem bearing axillary racemes and very young foliage, the details of which are scarcely discernible. The stem is 17,5 cm high, longitudinally striate and pubescent. The leaves have 2 pinnae pairs and up to 16 leaflets per pinna. The immature leaflets are up to 4,5 × 1,75 mm, the midrib is excentric basally and the leaflet-apex is distinctly mucronate. This specimen is hesitantly referred to E. woodii var. pubescens, but additional and better material from this area is required to establish the identity of the plants.

More material of var. *pubescens*, and from definite localities, is required. Pods would be of particular interest.

4. Elephantorrhiza burkei Benth. in Hook., Lond. J. Bot. 5: 81 (1846); Harv. in F.C. 2: 278 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 365 (1875); Phillips in Bothalia 1: 192, t.5 fig. 4 (1923); Bak. f., Leg. Trop. Afr. 3: 801 (1930); Burtt Davy, Fl. Transv. 2: 332 (1932); O. B. Miller in J. S. Afr. Bot. 18: 31 (1952); Wild, Guide Fl. Vict. Falls 149 (1953); Brenan & Brummitt in

F.Z. 3,1: 27 (1970); Palmer & Pitman, Trees S. Afr. 2: 825 (1973); Ross in Bothalia 11: 251 (1974). Type: Transvaal, Magaliesberg, *Burke & Zeyher* (K, holo.!; BM!; TCD!; Z!, ? iso.).

E. elephantina (Burch.) Skeels var. burkei (Benth.) Merr. in Contr. Gray Herb. 59: 18 (1919). Type as above.

A branched shrub or small tree 1–3(6) m high, occasionally as small as 0,3 m, but then the stems distinctly woody and branched and the inflorescences normally borne on lateral shoots of the current season's growth; bark dark-grey to reddish; young branchlets glabrous. Leaves glabrous or almost so: petiole 2,6-6,5 cm long: rhachis 3,6-14,5 cm long; pinnae (1)4-8(9) pairs; rhachillae 3,5-12,5 cm long; leaflets (9)12-23(32) pairs per pinna, $7-17 \times 1,5-$ 3,5(5) mm, narrowly oblanceolate to very narrowly elliptic or linear-oblong, usually glaucous, glabrous, base slightly asymmetric (less so than in E. elephantina), with the proximal side rounded to cuneate. apex symmetric, obtuse to rounded, generally mucronate, lateral nerves and veins prominent or not. Racemes axillary, solitary or fascicled, often on lateral shoots, 5-10(12,5) cm long (including the peduncle), glabrous. Flowers yellowish-white, on pedicels up to 2 mm long, pedicels articulated near the middle, with minute reddish glands at the base of the pedicels. Calyx campanulate, up to 2,5 mm long, 5-toothed, the teeth up to 0,75 mm long, glabrous. Petals shortly united basally, up to 4,5 mm long, 1 mm linear-oblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally: filaments up to 5 mm long; anthers up to 0,75 mm long, with a deciduous apical gland. Ovary up to 2 mm long, glabrous. Pods dark brown to reddish-brown, $10-19(28) \times 2.5-4$ cm, straight or slightly curved, oblong, compressed, sometimes prominently transversely venose, at maturity the valves separating from the persistent margins, the outer layer of the pod-wall peeling off the inner layer, the layers remaining intact or breaking up irregularly. Seeds \pm 9-13 imes8-12 mm.

Found in Botswana, Rhodesia, Mozambique and the Transvaal. Favours rocky situations, in woodland, grassland and scrub.

TRANSVAAL.—2329 (Pietersburg): University College of the North, 28,8 km from Pietersburg on road to Tzaneen, Van Vuuren 1293. 2425 (Gaberones): Lekkerlach, Louv 597 (NH). 2428 (Nylstroom): 15,2 km N. of Warmbaths, Marais 1236. 2429 (Zebediela): Chuniespoort, Pole Evans sub PRE 19452. 2431 (Acornhoek): Kruger National Park, 25,6 km N.E. of Skukuza, Codd 5723. 2527 (Rustenburg): Wolhuterskop, Schweickerdt 1642. 2528 (Pretoria): end of Daspoort range about 9,6 km E. of Pretoria, Phillips 3040. 2529 (Witbank): Loskop Dam Nature Reserve, Mogg 30609.

E. burkei differs from E. elephantina primarily in being a shrub or tree with branched perennial aerial stems and not a suffrutex with annual unbranched aerial stems (unless damaged). The leaflet-base in E. burkei is less asymmetric than in E. elephantina, and the midrib soon becomes \(\pm\) centric. The leaflets of E. burkei are typically larger than those of E. elephantina. E. burkei appears to have smaller seeds than E. elephantina, but more fruiting material is required to confirm this.

5. Elephantorrhiza praetermissa J. H. Ross in Bothalia 11: 252 (1974). Type: Transvaal, Lydenburg Distr., Steelpoort valley, near Sarahshof, Codd 9830 (PRE, holo.!; BM!; K!).

Shrub 1-2 m high; young branchlets grey- or reddish-brown, glabrous. Leaves glabrous: petiole 2,2-4 cm long; rhachis 4-9 cm long, sulcate above, sometimes with minute scattered dark glands; pinnae (3)5-10(12) opposite or subopposite pairs; rhachillae (2,8)3,5-6(7) cm long; leaflets 20-40 pairs, $5-10 \times 0.9-1.5$ mm, linear or linearoblong, sessile, glabrous, asymmetric basally, midrib starting in the distal corner of the leaflet-base and gradually becoming almost central in the leaflet, proximal side of base rounded, apex rounded or acute, nearly symmetric, lateral nerves not visible or inconspicuous beneath, sometimes with minute dark purplish glands at the base of the leaflets. Inflorescences racemose, racemes solitary, fascicled or aggregated on abbreviated lateral branchlets, 4-5,5 cm long (including the peduncle), glabrous. Flowers yellowish-white, pedicellate, pedicels 1,5-2 mm long, articulated near or below the middle, with minute dark reddish glands at the base of the pedicels. Calyx 0,75-1,25mm long, 5-toothed, glabrous. Petals shortly united basally, 2-3 mm long, linear-oblong, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments 4-5 mm long; anthers with a deciduous apical gland. Ovary ± 2 mm long,

linear, glabrous. *Pods* dark brown or reddishbrown, $12-18 \times 2-3$, 2 cm, oblong, straight or slightly curved, compressed, obscurely or prominently venose, at maturity the valves separating from the persistent margins. *Seeds* \pm 15 \times 13 \times 3,5 mm.

E. praetermissa appears to have a rather restricted distribution in the eastern Transvaal. Occurs on dry wooded hillsides.

TRANSVAAL.—2429 (Zebediela): 25 km N.N.W. of Schoonoord (—DB), Acocks 20969. 2430 (Pilgrim's Rest): 59,2 km from Lydenburg on road to Steelpoort via Tweefontein (—CC), Vorster 2129; 74,4 km from Lydenburg on road to Steelpoort via Tweefontein (—CC), Vorster 2128.

E. praetermissa is most closely related to E. goetzei and to E. elephantina. Both E. goetzei and E. elephantina occur in the eastern Transvaal, but the specimens in question differ from the material of both of these species.

E. praeterniissa differs from typical E. goetzei in having consistently fewer pinnae pairs. The leaflets of E. praetermissa differ from those of E. goetzei in having a somewhat thicker texture and in being \pm sessile; the leaflets of typical *E. goetzei* usually have distinct petiolules. In *E. goetzei* the pods are long and narrow in proportion to their length (15-44 \times 1,3-2,2 cm) and, when mature, the position of the seeds is marked by distinct raised bumps. In E. praetermissa the pods are shorter and broader (12-18 \times 2-3,2 cm), + compressed, and lack distinct raised bumps over the seeds. The seeds of E. praetermissa are ± compressed in contrast to the ellipsoid or lenticular seeds of E. goetzei, and they are smaller than those of the latter. Although the length of the racemes provides no discontinuity between the two species, the racemes of E. praetermissa are consistently short and are much shorter than is usual in E. goetzei.

E. praetermissa differs from E. elephantina in being a robust shrub 1-2 m high and in having branched aerial stems. The leaflets of E. praetermissa differ slightly in texture and lack the conspicuous venation of typical E. elephantina, while the pods tend to be slightly narrower than is usual in E. elephantina.

Although E. praetermissa is described as locally common by collectors, very few specimens have been collected. More material is required.

6. Elephantorrhiza goetzei (Harms) Harms in Engl., Pflanzenw. Afr. 3,1:400 (1915); Bak.f., Leg. Trop. Afr. 3:802 (1930); Brenan, Checklist Tang. Terr. 344 (1949); Wild, Guide Fl. Vict. Falls 149 (1953); Williamson, Useful Pl. Nyasal. 52 (1955); Brenan in F.T.E.A. Legum.-Mimos.: 19, fig. 4 (1959); White, For. Fl. N. Rhod. 91 (1962); Brenan & Brummitt in F.Z. 3,1:24, t.4 (1970); Palmer & Pitman, Trees S. Afr. 2:827 (1973) Ross in Bothalia 11:253 (1974). Type: Tanzania, Rufiji District, Goetze 82 (B, holo.†, BM, drawing!; K, iso.!).

Piptadenia goetzei Harms in Bot. Jahrb. 28: 397 (1900). Type as above.

subsp. goetzei.

E. rubescens Gibbs in J. Linn. Soc. Bot. 37: 441 (1906); Eyles in Trans. Roy. Soc. S. Afr. 5: 364 (1916). Type: Rhodesia, Matopo Hills, Gibbs 184 (BM, holo.!). E. cf. petersiana sensu Gomes e Sousa, Pl. Menyharth. 70 (1936). E. cf. goetzei (Harms) Harms, Torre in C.F.A. 2: 263 (1956). E. sp. sensu Torre I.c.: 264.

Acacia rehmanniana sensu M. A. Exell in Bol. Soc. Brot. Sér. 2,12:16 (1937), non Schinz.

Shrub or small tree 1-4(7) m high; bark grey-brown to dark brown or reddishbrown to purplish, often becoming blackish: young branchlets glabrous. Leaves glabrous or nearly so: petiole 1-5(7,5) cm long; rhachis 6-20(45,5) cm long, sulcate above; pinnae 3-30(41) opposite or subopposite pairs: rhachillae 1,8-9 cm long; leaflets 9-40(48) pairs, $3,5-12 \times 0,7-2,75$ mm (in our area), linear-oblong to narrowly oblong, midrib starting in the distal corner of the leaflet-base, gradually becoming almost central in the leaflet, proximal side of the base rounded and almost auriculate, apex acute to rounded and mucronate, nearly symmetric, glabrous, lateral nerves and veins not or scarcely visible. Racemes solitary, fascicled or borne on short lateral shoots, (2)5-20 cm long (including the peduncle), glabrous. Flowers yellowish-white, sometimes tinged with pink or purple, on pedicels up to 1 mm long, pedicels articulated near the middle. with minute pale yellowish-white glands at the base of the pedicels. Calyx 1,5-1,75 mm long, with 5 acute teeth, glabrous. Petals shortly united below, becoming almost free in open flowers, 2,5-3 mm long, linear-oblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 4,5 mm long; anthers up to 1 mm long, with a deciduous apical gland. Ovary up to 2 mm long, linear, glabrous. Pods dark brown or reddishor purplish-brown, $15-30(44) \times 1,3-2,2$ cm, linear, straight or curved, raised over the seeds, at maturity the valves separating from the persistent margins, the outer layer of the pod-wall peeling off the inner layer, the layers remaining intact or breaking up irregularly. Seeds $11-20 \times 9-18 \times 7-12$ mm, ellipsoid to lenticular.

Found in Tanzania, Angola, Botswana, Zambia, Rhodesia, Malawi, Mozambique and the Transvaal. Occurs in woodland of various types and scrub; favours rocky places.

TRANSVAAL.—2331 (Phalaborwa): Kruger National Park, Shingwedzi, in Lebombo Mts., Van der Schifff 3848. 2429 (Zebediela): Wolkberg, 14,4 km S. of Boyne on road to Welcome Gold Mine, Codd 10393. 2430 (Pilgrim's Rest): 28 km S.E. of Gravelotte (—BB), Codd 9477; Abel Erasmus Pass, c. 3 km S. of Strydom Tunnel (—BC), Vorster & Coetzer 2099. 2431 (Acornhoek): Kruger National Park, ± 29 km from Satara on Rabelais road (—BC), Van der Schifff 3290; Kruger National Park, 10,4 km from Nwanedzi [Ngwanetsi] on Satara road (—BD), Story 3967.

In the area delimited for Flora Zambesiaca E. goetzei frequently produces its flowers when the plant is leafless. In the Transvaal, however, E. goetzei usually produces flowers together with the leaves.

It is possible that *E. petersiana* Bolle in Peters, Reise Mossamb. Bot. 1:9 (1861) is an earlier name for *E. goetzei*. If this were ever confirmed, then *E. petersiana* would be the correct name for this species. The holotype of *E. petersiana*, now destroyed, was a flowering specimen (without leaves) collected by Peters at Sena in Mozambique. Unfortunately the type description is too imperfect to enable the species to be positively identified. Bak.f., Leg. Trop. Afr. 3: 802 (1930) shed no light on the identity of *E. petersiana*.

Burtt Davy, Fl. Transv. 2:332 (1932), based his E. (?) sp. nov.? [=E. (?) elongata Burtt Davy ined.] on Burtt Davy H2304 collected at Potgietersrust in the Transvaal. This specimen, which is quite leafless, has ±straight immature pods up to 21 × 1,7 cm. The pods of Burtt Davy H2304 resemble those of E. goetzei fairly closely and, although E. goetzei has not been recorded from Potgietersrust subsequently, it seems likely that Burtt Davy's specimen is referable to E. goetzei. E. (?) sp. nov. ? is therefore a probable synonym of E. goetzei.

Subsp. lata Brenan & Brummitt is recorded from Zambia and Rhodesia. It differs from subsp. goetzei in having fewer pinnae pairs and fewer pairs of larger leaflets.

7. Elephantorrhiza rangei Harms in Bot. Jahrb. 49: 420 (1913); Dinter in Feddes Repert. 17: 190 (1921); Bak.f., Leg. Trop. Afr. 3: 802 (1930); Range in Feddes Repert. 30: 148 (1932); Schreiber in F.S.W.A. 58: 17 (1967) pro parte quoad specim. Range 455; Ross in Bothalia 11: 254 (1974). Type: South West Africa, Keetmanshoop Distr., Naute, near Keetmanshoop, Range 455 (B, holo. †, BM, drawing!; BOL, SAM, iso.!).

A branched shrub (? or small tree) to 4 m high; young branchlets reddish-brown to purplish, glabrous. *Leaves* glabrous: petiole 2-4,5 cm long; rhachis (1,5) 3-7,5 cm long [petiole and rhachis together described as 2-15 cm long by Harms]; pinnae

3-7[9] opposite or subopposite pairs, sometimes 1-3 pairs on immature leaves; rhachillae 5-8,5[9] cm long; leaflets 24-36 pairs per pinna, $6-9[12] \times 1-2.75[4]$ mm, linear-oblong to oblong, sometimes slightly falcate, midrib starting in the distal corner of the leaflet-base, gradually becoming almost central in the leaflet, proximal side of the base rounded to almost auriculate, apex rounded to acute, mucronate, almost symmetric. lateral nerves inconspicuous, glabrous. Racemes axillary, solitary or paired, 5.5-8 cm long (including the peduncle), glabrous. Flowers greenish-yellow, on pedicels 1-1,75 mm long, pedicels articulated just below the middle, with minute yellowish glands at the base of the pedicels. Calyx campanulate, 2-2,25 mm long, glabrous, 5-toothed. *Petals* shortly united basally, 3-4 mm long, 1 mm wide, oblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 5,5 mm long; anthers up to 0,9 mm long, with a deciduous apical gland. Ovary up to 4 mm long, shortly stipitate, linear, glabrous. Pods dark brown or reddish-brown, $18,5-20[22] \times 2-2,5$ cm, straight or almost so, oblong, compressed, slightly umbonate over the seeds, transverse venation relatively inconspicuous, at maturity the valves separating from the persistent margins. Seeds unknown.

Known only from the type locality in South West Africa. Ecology unknown.

S.W.A.—2617 (Bethanie): Naute, near Keetmanshoop (—DD), Range 455 (BOL, SAM).

The above description was drawn up from two isotypes in the SAM Herbarium. The extreme dimensions given in square brackets were recorded by Harms in his type description.

There is considerable variation in leaflet size even on a single branch; the upper leaves often have small leaflets and the lower leaves larger leaflets.

E. rangei bears a superficial resemblance to E. suffruticosa but differs in having larger and broader leaflets in which the midrib is \pm centric apically, slightly longer pedicels, and larger flowers.

The specimens cited by Phillips in Bothalia 1:192 (1923) under *E. rangei* ("rangeri"), and on which t.5 fig. 5 was based, are in fact referable to *E. elephantina*.

E. rangei is known only from the type collection. It has never been re-collected since Jan. 1908 and the possibility exists that it is now extinct. A thorough search for this plant in the type locality is most desirable in an attempt to evaluate its present conservation status.

MIMOSOIDEAE 147

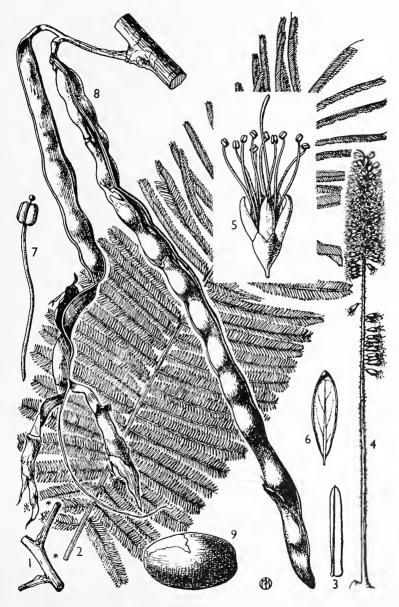

FIG. 22.—Elephantorrhiza goetzei subsp. goetzei, 1, part of branch with petiole-bases, × \(\frac{1}{4}\); 2, leaf, detached from petiole-base of 1, × \(\frac{1}{4}\); 3, leaflet, × 6, all from Milne-Redhead & Taylor 9549; 4, flowering raceme, × 1\(\frac{1}{4}\); 5, flower, × 9; 6, petal, × 15; 7, anther, × 25, all from Andrada 1452; 8, pods, × 1; 9, seed, × 3, both from Jackson 1418. Reproduced by permission of the Editor of Flora of Tropical East Africa.

8. Elephantorrhiza schinziana Dinter in Feddes Repert. 17: 190 (1921); Bak.f., Leg. Trop. Afr. 3: 802 (1930); Schreiber in F.S.W.A. 58: 17 (1967); Ross in Bothalia 11: 255 (1974). Type: South West Africa, Grootfontein Distr., Otavi, Dinter 745 (SAM, lecto.!).

A branched shrub (? or small tree) up to 2.5 m high; bark grey- to dark- or reddishbrown; young branchlets grey- or reddishto purplish-brown, glabrous. Leaves glabrous: petiole 2,2-3,5(5,2) cm long; rhachis (4,5)7,5-14,5(20,5) cm long; pinnae (2)6-11(14) opposite or subopposite pairs; rhachillae 5,5-10(14) cm long; leaflets (14)21-40 pairs per pinna, $(5)7-14 \times 1,5-3,5$ mm, linearoblong to oblong, midrib starting in the distal corner of the leaflet-base, gradually becoming almost central in the leaflet, proximal side of base rounded, apex rounded and sometimes distinctly mucronate, nearly symmetric, lateral nerves scarcely visible. glabrous, somewhat glaucous. Racemes axillary, solitary or paired, 7-9,5 cm long (including the peduncle), glabrous. Flowers vellowishwhite, on pedicels up to 0,75 mm long, pedicels articulated towards the apex, with minute vellowish glands at the base of the pedicels. Calyx cupular, up to 1,5 mm long, glabrous, shortly 5-toothed. Petals shortly united basally, 3-3,75 mm long, 1 mm wide, linearoblong, inflexed apically, glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 5 mm long; anthers up to 0,8 mm long, with a deciduous apical gland. Ovary up to 2,25 mm long, glabrous. Pods dark brown or reddishbrown, $(15)19-30(40,5) \times 3-3.9$ cm, straight or slightly curved, oblong, compressed, umbonate over the seeds, prominently transversely venose, at maturity the valves separating from the persistent margins, the outer layer of the pod-wall peeling off the inner layer, the layers tending to break up irregularly. Seeds immature, mature seeds unknown.

Known only from the Grootfontein District in South West Africa. Ecology unknown.

S.W.A.—1917 (Tsumeb): farm Heidelberg near Tsumeb (—BB), Dinter 1689 (SAM); Otavi (—CB), Dinter 745 (SAM), Dinter 5300 (BOL, PRE, Z). Grid ref. unknown: Grootfontein District, farm Asis, Volk 767 (M).

The original specimens on which Dinter based his description are no longer available for study. Fortunately, however, both syntypes, namely *Dinter 745*

and 1689, are represented in the South African Museum collections. There is one sheet of Dinter 745 and three sheets of Dinter 1689. One of the sheets of Dinter 1689 is a mixed gathering consisting of a vegetative shoot of E. suffruticosa and a pod of E. schinziana, while the flowers in the capsule could belong to either species. On the second sheet of Dinter 1689 there is a vegetative shoot of E. schinziana with a mature pod attached and, in addition, there is a flowering specimen which is leafless apart from an extremely young leaf or shoot on which no details are discernible. In view of the mixed gathering of E. schinziana and E. suffruticosa on the first sheet of Dinter 1689, the possibility exists that the flowering specimen on the second sheet belongs to E. suffruticosa and not to E. schinziana. It will be recalled that in South West Africa E. suffruticosa usually flowers when leafless. As none of the other specimens of E. schinziana examined were in flower, the details of the flowers in the above description were taken from this second specimen of *Dinter* 1689. It is possible therefore that the flowers described are those of E. suffruticosa and not of E. schinziana. The third sheet of Dinter 1689 consists of a single leaf and two mature pods (the valves of one pod are mounted separately which gives the impression that there are three pods).

There is considerable variation in leaflet size even on a single branch; some of the upper leaves often have distinctly smaller leaflets than the leaflets on the lower leaves.

E. schinziana has not been re-collected since Jan. 1939 and there is a possibility that it is now extinct. A thorough search for this plant in the type localities is most desirable in an attempt to evaluate its present conservation status. If E. schinziana is re-discovered, it is important that an effort be made to collect both flowering and fruiting material. Flowering material is essential to establish whether or not the flowers on which the above description was based are in fact those of E. schinziana.

9. Elephantorrhiza suffruticosa Schinz in Mém. Herb. Boiss. 1: 117 (1900); Dinter, Deutsch-Sudwest-Afrika Fl. Forst und landwirtschaft. Frag. 78 (1909); Harms in Engl., Pflanzenw. Afr. 3,1: 400 (1915); Dinter in Feddes Repert. 17: 190 (1921); Phillips in Bothalia 1: 193, t.5 fig. 7 (1923); Bak. f., Leg. Trop. Afr. 3: 801 (1930); Schreiber in F.S.W.A. 58: 17 (1967); Brenan & Brummitt in F.Z. 3,1: 26 (1970); Ross in Bothalia 1: 255 (1974). Type: Angola, Huila district, "Kilevi am Kunene" (south of Humbe), Schinz 2071 (Z, lecto.!).

A branched shrub or small tree 1-5 m high; bark grey-brown to dark- or reddishbrown; young branchlets glabrous or sometimes puberulous to shortly pubescent: Leaves glabrous to puberulous or shortly pubescent: petiole (0,6)1,5-3,5 cm long; rhachis (0,5)10-17(25,4) cm long; pinnae (2)15-27(42) opposite or subopposite pairs;

rhachillae (1,4)2-3,5(6,8) cm long; leaflets (17)27-40(50) pairs per pinna, 3-7,5 \times 0,5-1,2 mm, linear-oblong to linear, rarely almost falcate, midrib marginal throughout, proximal side rounded basally, apex asymmetric, obtuse to acute, often mucronate, lateral nerves and veins not or scarcely visible. glabrous or sometimes sparingly pubescent on the margins. Racemes axillary, solitary or 2-3 together, or borne on lateral shoots. (4)6-14(18) cm long (including the peduncle), pubescent or sometimes glabrous. Flowers yellowish-white, on pedicels up to 1 mm long, pedicels articulated near the middle, with minute reddish or reddish-brown glands at the base of the pedicels. Calyx cupular, up to 1 mm long, shortly 5-toothed, glabrous or sometimes very sparingly pubescent. Petals shortly united basally, 3-3,75 mm long, 1 mm linear-oblong, inflexed apically. glabrous. Stamens free among themselves, slightly adnate to the corolla basally; filaments up to 5 mm long; anthers up to 0,8 mm long, with a deciduous apical gland. Ovary up to 2 mm long, linear, glabrous. Pods dark brown or reddish-brown, 8,5- $30,5 \times 1,8-2,25$ cm, straight or slightly curved, linear-oblong to oblong, compressed, usually prominently transversely venose. umbonate over the seeds, at maturity the valves separating from the persistent margins. the outer layer of the pod-wall peeling off the inner layer, the layers remaining intact or breaking up irregularly. Seeds $13-15 \times 9-12$ mm, roughly ellipsoid.

Found in Angola, South West Africa, Rhodesia and Mozambique. Occurs in woodland, grassland and in broken country; often among rocks. The ecological preferences of *E. suffruticosa* are not clear and more information is required.

S.W.A.—1814 (Otjitundua): Otusemba, Story 5920. 1815 (Okahakana): 84,4 km N. of Okakeujo on road to Ondongua, De Winter 3617. 1816 (Namutoni): Amutele, Schinz 2070 (Z). 1817 (Tsintsabis): 48 km N. of Tsumeb, Rodin 2605. 1916 (Gobaub): farm Zukov 337, De Winter 3019. 2016 (Otjiwarongo): Otjiwarongo, Liebenberg 4909. 2116 (Okahandja): Okahandja, Dinter 314 (BM, E, GRA, Z). 2117 (Otjosondu): Omupanda, Wulfhorst s.n. (Z). 2214 (Swakopmund): Swakopmund, Seydel 1146 (Z). 2215 (Trekkopje): Ebony Mine, Schenck 457 (Z). 2216 (Otjimbingwe): Auas Mts., pass between Haris and Aub, Pearson 9658 (K). 2217 (Windhoek): Windhoek, Rogers 29755. 2317 (Rehoboth): Rehoboth, Fleck 499a (Z). 2416 (Maltahöhe): Bull's Mouth Pass, Pearson 8919; Bullsport, Naukluft Mts., Hardy 1982. 2417 (Mariental): Voigtsgrund, Keet 1662. Grid ref. unknown: "sandige stellen bei Ombalambuenge", Rautanen 242 (Z).

The narrow leaflets of *E. suffruticosa*, with the midrib marginal throughout the length of the leaflet, are most diagnostic and enable this species to be readily distinguished from all of the other *Elephantorrhiza* species.

There appears to be a discontinuity in the distribution of E. suffruticosa between eastern and central Rhodesia and South West Africa and Angola. No significant morphological differences have been so far noted between specimens from these two areas of distribution except for an inconsistent tendency for some leaflets to be more acute and mucronate in Rhodesia than in South West Africa and Angola. In addition, in specimens from Rhodesia there are usually \pm conspicuous reddish or orange glands at the base of the leaflets, while in Angola and South West Africa the glands are inconspicuous and pale yellow or even absent.

In the Flora Zambesiaca area E. suffruticosa usually produces flowers together with the leaves, while E. goetzei usually flowers when leafless. In South West Africa, however, E. suffruticosa frequently flowers when leafless, while in the Transvaal E. goetzei usually produces flowers together with the leaves. In the area delimited for the Flora of Southern Africa, therefore, the reverse situation tends to prevail.

The reason for selecting Schinz 2071 from Kilevi am Kunene in Angola as the lectotype of E. suffruticosa is discussed in Bothalia 11: 256 (1974). As mentioned in Bothalia 1.c., having selected Schinz 2071 as the lectotype of E. suffruticosa, it was most disconcerting to find that Schinz, in Mém. Herb. Boiss. 1: 105 (1900), cited Schinz 2071 from Olukonda-Oshiheke in Amboland, South West Africa, as one of the syntypes of Acacia arenaria Schinz. Fortunately I have examined this syntype of Acacia arenaria and can vouch for its identity. In any event, it seems unlikely that Schinz 2071 from Olukonda-Oshiheke in South West Africa, a syntype of Acacia arenaria, would ever be confused with Schinz 2071 from Kilevi am Kunene in Angola, the lectotype of Elephantorrhiza suffruticosa. It is as well, however, to draw attention to the existence of these two Schinz specimens each numbered 2071.

Insufficiently known species

10. Elephantorrhiza sp. Ross in Bothalia 11: 257 (1974).

Suffrutex producing at ground level unbranched, longitudinally striate, glabrous stems 60–80 cm high. *Leaves* glabrous or almost so: petiole 3–4,5 cm long; rhachis 7,5–18 cm long; pinnae 3–8 opposite or subopposite pairs; rhachillae 7,5–10 cm long; leaflets 13–22 pairs per pinna, 9–11 × 3–5 mm, very oblique, broadly truncate basally or sometimes slightly auricled on the proximal side, asymmetric and attached by one corner, the midrib starting in the distal corner of the leaflet-base and gradually becoming almost central in the leaflet, rounded to acute or distinctly mucronate

apically, glabrous throughout or with few minute marginal cilia. Flowers and pods unknown.

Known from two gatherings from the eastern

CAPE.—3128 (Umtata): Umtata aerodrome (-DA), Strev 11073; Strev 11165.

The two Strey gatherings do not appear to match material of any of the existing species. Like E. elephantina and E. obliqua, the specimens have unbranched aerial stems. The Strey specimens, which were growing in association with E. elephantina, appear to differ from this species in having larger leaflets, and from E. obliqua in having larger leaves with more numerous pinnae and leaflet pairs, and leaflets without a conspicuous venation. More material, particularly fertile material, is required to enable a positive identification to be made. The specimens seem to be most closely related to E. elephantina and the possibility exists that they are only a variant of this species.

Gigalobium P. Br., Hist. Jamaic. 362 (1789).

Adenopodia C. Presl, Epimel. Bot. 206 (1849).

Pusaetha L. ex Kuntze, Rev. Gen. Pl. 1: 204 (1891); Taub. in Pflanzenfam. 3, 3: 122 (1892).

Entadopsis Britton in N.Amer. Fl. 23: 191 (1928); Gilbert & Boutique in F.C.B. 3: 203 (1952).

Trees (not in our species), scandent shrubs, suffrutices or lianes; prickles present or absent. Leaves bipinnate; petioles eglandular or sometimes glandular; rhachis sometimes ending in a tendril; pinnae each with one to many pairs of leaflets. Inflorescences of spiciform racemes or spikes which are axillary or supra-axillary, solitary or clustered and often + aggregated. Flowers hermaphrodite or male, 5-merous. Calvx gamosepalous, with 5 short teeth. Petals 5, free or nearly so or + connate, separated from the ovary-base by a very short perigynous zone composed of stamens adnate to an apparent corolla-tube. Stamens 10, fertile, free or united basally; anthers with a usually very caducous apical gland. Ovary sessile or shortly stipitate; stigma terminal. Pods straight or curved and almost falcate, flat or rarely spirally twisted, sometimes enormous; at maturity the valves (but not the margins) splitting transversely into 1-seeded segments from which the outer layer (exocarp) of the pod-wall often peels off, the inner layer (endocarp) persisting as a closed envelope around the seed; the segments usually falling away from the margins which persist as a continuous but empty frame. Seeds (in the African species at least) + compressed, elliptic or subcircular in outline, deep brown, smooth.

A genus of \pm 30 species, widespread and mainly tropical; about 20 species in Africa and Madagascar, about four species in America. Four species occur in our area.

Entada is a southern Indian (Malabar) name used by van Rheede for E. monostachya (i.e. E. pursaetha).

Leaf-rhachis ending in a forked tendril; large unarmed woody liane with 1-2 pinnae pairs per leaf; leaflets 3-5 pairs, 25-75 × 11-35 mm; pods gigantic, up to 2 m long, 7-15 cm wide, woody.....1. E. pursaetha

Leaf-rhachis not ending in a forked tendril; suffrutex, scandent shrub or woody climber, unarmed or armed with scattered recurved prickles, with 1-7 pinnae pairs per leaf, leaflets 6-13 pairs, smaller than above; pods at most 0,25 m long, 6 cm wide, coriaceous:

Suffrutex with erect annual stems, unarmed; pinnae 2-4 pairs per leaf; leaflets 15-40 × 7-20 mm; Woody climber or scandent shrub, unarmed or armed; pinnae 1-7 pairs per leaf; lcaficts $7,5-20 \times 1,75-7(9)$ mm; flowers yellowish-white or dark purple or red:

Legum.-Mimos.: 12 (1959); in F.Z. 3,1: 15, t.3D (1970); Ross Fl. Natal 194 (1973). Type: A plant cultivated in Mauritius, Delessert (G-DC, lecto.; K, photo.!).

Entada monostachya DC., Prodr. 2: 425 (1825); Mém. Leg. 422 (1826). Type: Rheede, Hort. Malabar. 9: 151, t.77 (1689). E. scandens sensu Harv. in F.C. 2: 276 (1862); Sim, For. Fl. P.E. Afr. 52 (1909), non (L.) Benth. E. gigas sensu Bak. f., Leg. Trop. Afr. 3: 785 (1930) pro parte; Henkel, Woody Pl. Natal 237 (1934); Gilbert & Boutique in F.C.B. 3: 220 (1952), non (L.) Fawc. & Rendle. E. phaseoloides sensu Brenan, Checklist Tang. Terr. 344 (1949); Torre in Mendonca, Contr. Conhec. Fl. Mocamb. 2: 87 (1954), non (L.) Merr. E. gogo (Blanco) I. M. Johnston in Sargentia 8: 137 (1949). Type as for Adenanthera gogo Blanco.

Adenanthera gogo Blanco, Fl. Filip. 353 (1837). No

type specimen extant.

Large liane up to 75 m long, climbing to the tops of the tallest trees, unarmed; young branchlets glabrous or rarely (but not in our area) pubescent. Leaves: petiole up to 5 cm long, eglandular; rhachis ending in a forked tendril; pinnae 1-2 pairs; rhachillae 5,5-15 cm long; leaflets 3-5 pairs, $25-75 \times 11-35$ mm, elliptic to obovate-elliptic, obtuse or rounded apically, emarginate, glabrous or nearly so except for puberulence on the midrib above and near the base of the leaflet beneath. Stipules up to 3 mm long, deciduous. Inflorescences spicate, spikes axillary on lateral branches which are sometimes leafless and abbreviated, the spikes thus aggregated; spikes 6,5-15 cm long, axes pubescent; peduncles 1-6 cm long. Flowers yellowishwhite or greenish-yellow, sessile or on pedicels up to 0,5 mm long. Calyx cupular, \pm 1,25 mm long, shortly 5-toothed, glabrous or rarely (but not in our area) pubescent. Petals free, \pm 2,5 mm long, glabrous. Stamens linear, ± 6 mm long; anthers with an apical caducous gland. Ovary up to 2,25 mm long, glabrous. Pods gigantic, 0,5-2 m long, 7-15 cm wide, woody, straight or curved, but not spirally twisted, outer leathery layer of the pod-wall falling away to expose a

reddish-brown woody rigid inner layer, ultimately breaking up transversely into 1-seeded segments. Seeds deep brown, \pm 5 \times 3,5-5 cm, hard, smooth.

Widely distributed in tropical Africa; also from India to China, the Philippines, Guam and N. Australia. In our area it is found at low altitudes on the Zululand coast, particularly in the vicinity of Port Durnford. Occurs in riverine fringing vegetation and in swamp forest, the plants climbing to the canopy of the tallest trees.

NATAL.—2831 (Nkandla): Port Durnford (—DD), Lawn 1849 (NH); Lawn 1849a (NH);

Strey 9919.

Some years ago a solitary plant, Ward 5315 (GRA, NU), was found just south of Durban at Jeffels Hill-South, Isipingo. It is not known whether or not this plant was introduced. The plant has since disappeared and the species is now not known to occur south of the Mtunzini District.

Despite the size of the pods, they are seldom easily visible owing to the density of the supporting canopy. In falling, the pods often break up partially into transverse segments. It is indeed remarkable that these enormous pods develop from such small ovaries.

Few specimens of *E. pursaetha* have been collected in our area and more material is desired.

The seeds of *E. pursaetha*, and probably also those of *E. gigas* (L.) Fawc. & Rendle, are frequently washed up on the Natal beaches and sometimes are also found on the Transkei coast. *E. gigas* differs from *E. pursaetha* in that the gigantic pods are spirally twisted and the flowers are on distinct slender pedicels 1-2 mm long.

2. Entada arenaria Schinz in Mém. Herb. Boiss. 1: 118 (1900); Schreiber in F.S.W.A. 58: 17 (1967); Ross in Bothalia 11: 126 (1973). Type: South West Africa, Grootfontein Distr., mittelauf des Omuramba Omatako, Schinz 277 (Z, holo.!).

subsp. arenaria.

Ross in Bothalia 11: 126 (1973)

Entada nana Harms in Warb., Kunene-Samb. Exped. 244 (1903); Harms in Engl., Pflanzenw. Afr. 3, 1: 403 (1915); Bak. f., Leg. Trop. Afr. 3: 787 (1930); Torre in C.F.A. 2: 258, t.51 (1956); F. White, For. Fl. N. Rhod. 92 (1962); Brenan in F.Z. 3, 1: 19 (1970). Type: Angola, Habungu, Baum 471 (B, holo. †; E, iso.!).

Suffrutex with erect annual stems up to 1,2 m high, unarmed, stems densely pubescent to subglabrous when young, longitudin-

ally striate. Leaves densely puberulous or pubescent: petiole 6-12 cm long, sulcate above: rhachis 4-17 cm long, sulcate above: pinnae 2-4 pairs; rhachillae 7.5-14 cm long; leaflets 7-13 pairs, $(12)20-35(40) \times 7-20$ mm, narrowly oblong, oblong or obovate-oblong, very asymmetric basally, the proximal side rounded to cordate and the distal side cuneate to cuneate-rounded, rounded to emarginate apically, lateral nerves conspicuous, pubescent throughout on lower surface or pubescence confined to the midrib, sometimes glabrous throughout. Inflorescences spicate. axillary, solitary or 1-3 together; spikes 4-10 cm long, axes glabrous to sparingly pubescent; peduncles up to 1,5 cm long. Flowers pale yellowish-white, on pedicels up to 1,75 mm long. Calyx campanulate, 1-2 mm long, 5-toothed, glabrous. Petals free or very shortly united basally, \pm 3 mm long, glabrous. Stamens up to 6,5 mm long; anthers with an apical caducous gland. Ovary up to 2 mm long, sessile, glabrous. Pods $11-22 \times 3,5-5(6)$ cm with a stipe up to 3 cm long, compressed, curved or distinctly falcate, subcoriaceous, the valves splitting transversely into 1-seeded segments. Seeds deep brown, $+12.5 \times 9$ mm, smooth.

Found in Angola, South West Africa, Zambia and Rhodesia. Occurs in deep sand, often in woodland.

S.W.A.—1718 (Kuring-Kuru): 4,8 km S. of Omuramba Mpungu on road to Tsintsabis, De Winter 3911. 1819 (Karakuwisa): 32 km S. of Runtu, De Winter 3808. 1820 (Tarikora): 16 km N. of Tamso on road to Kapupahedi, De Winter & Marais 4718. 1821 (Andara): near Shamvura Camp, De Winter & Wiss 4448. 1918 (Grootfontein): Omuramba Omatako, Schinz 277 (Z). 1920 (Tsumkwe): 48 km N. of Gautscha Pan, Story 6435.

Subsp. *microcarpa* (Brenan) J. H. Ross, which occurs in Zaire and in Zambia, differs from subsp. *arenaria* in having smaller and narrower pods.

3. Entada wahlbergii Harv. in F.C. 2:277 (1862); Benth. in Trans. Linn. Soc. Lond. 30:364 (1875); Torre in Mendonca, Contr. Conhec. Fl. Mocamb. 2:87 (1954); Brenan in Kew Bull. 10:169 (1955) pro parte excl. specim. Michelmore & Bullock; Keay in F.W.T.A. ed. 2,1:492 (1958); Brenan in F.T.E.A. Legum.-Mimos.: 18 (1959) pro parte excl. specim. Tanganyika; Brenan in F.Z. 3,1:22, t.3C (1970); Ross, Fl. Natal 194 (1973); in Bothalia 11:125 (1973). Type: Natal, probably Zululand, Wahlberg s.n. (S, holo.; K, PRE, photo).

Pusaetha wahlbergii (Harv.) Kuntze, Rev. Gen. Pl. 1:204 (1891). Type as above.

Entada flexuosa Hutch. & Dalz. in F.W.T.A. 1:356 (1928); in Kew Bull. 1928:401 (1928). Type: Nigeria, Northern Prov., Nupe, Barter 991 (K, holo.!).

Entadopsis flexuosa (Hutch. & Dalz) Gilbert & Boutique in F.C.B. 3: 206 (1952). Type as for Entada flexuosa. Entadopsis wahlbergii (Harv.) Pedro in Bol. Soc. Est. Moçamb. 92: 10 (1955). Type as for Entada wahlbergii.

Slender unarmed woody climber up to m high; young branchlets glabrous, flexuous. Leaves: petiole 1.8-4.8 cm long. glabrous; rhachis 0-4 cm long; pinnae (1) 2 (3) pairs; rhachillae 2,5-6,5 cm long, one or more of the rhachillae, usually the terminal ones, sometimes modified into a tendril or spirally twisted basally and bearing leaflets above; leaflets 6-12 pairs, 8-18 \times 1,75-4,5 mm, obliquely-oblong, asymmetric basally, rounded apically and usually slightly mucronate, glabrous. Stipules inconspicuous. Inflorescences spicate, axillary, solitary, often aggregated on short leafless shoots or occupying terminal parts of the shoots; spikes 3-5,5 cm long, axes glabrous; peduncles 4–10 mm long. Flowers dark purple or red, on pedicels 1-1,5 mm long. Calyx green. cupular, up to 1,5 mm long, 5-toothed, glabrous. Petals green, up to 3,5 mm long, 1,4 mm wide, united with the stamens and ovary into a basal tube \pm 1 mm long, glabrous, apex of each petal with an inwardly deflexed appendage. Stamens dark purple or red, 4-6,5 mm long; anthers yellowish, with an apical caducous gland. Ovary up to 2,5 mm long, sessile, glabrous. Pods $11-28 \times 2,8-4$ cm, with a stipe 1-2 cm long, compressed, curved or often falcate, subcoriaceous, the valves splitting transversely into 1-seeded segments. Seeds 9-11 × 7-10 mm, deep brown, smooth; areole $5.5-6.5 \times 4-5$ mm.

Widespread in Africa from Portuguese Guinea and Mali to Nigeria, the Sudan, southwards to Zaire, Mozambique and Natal. Occurs in bushveld, valley scrub and on the banks of dry watercourses and streams, usually on dry sandy soil.

NATAL.—2831 (Nkandla): 22,4 km S.S.W. of Nongoma (—BA), Acocks 13012; Umfolozi Game Reserve, near Tobothi (—BD), Ross 2059; Umhlatuzi valley, Melmoth road, not far from Empelengeni bridge (—DA), Lawn 2198 (NH). 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 1892 (NH); Ward 2230 (GRA, NH). 2931 (Stanger): Tugela Valley, below San Souci, Edwards 1659; 4,8 km from Mandini on Tugela mouth road, Edwards 1630. Grid ref. unknown: without locality, Gerrard 1706 (BM, K).

MIMOSOIDEAE 153

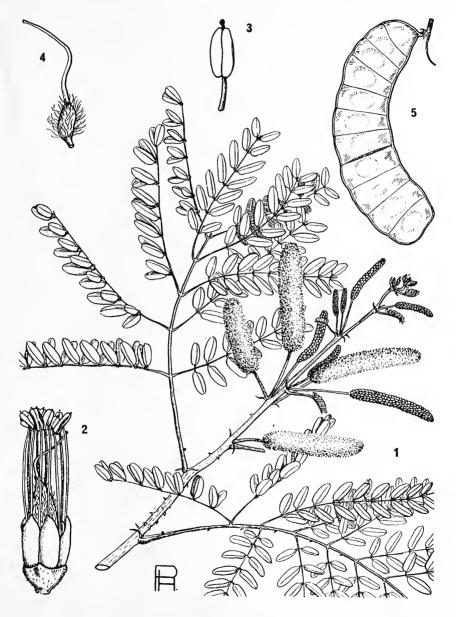

FIG. 23.—Entada spicata. 1, flowering branch, \times $\frac{2}{3}$; 2, flower, \times 8; 3, anther, \times 12; 4, ovary, \times 10, all from Ward 1898; 5, pod, \times $\frac{2}{3}$, Ross 962.

E. wahlbergii is a variable species. In our area it is found almost entirely in Zululand at altitudes below 350 m. There is but a single gathering south of the Tugela River.

A number of tropical species with dark purple or red flowers are closely related to E. wahlbergii. E. stuhlmannii (Taub.) Harms from Tanzania and Mozambique differs from E. wahlbergii in having comparatively large leaflets with readily visible lateral nerves and nervation. This species has often been confused with E. wahlbergii in the past; Bak. f., Leg. Trop. Afr. 3: 788 (1930) based his account of E. wahlbergii on a specimen of E. stuhlmannii.

4. Entada spicata (E. Mey.) Druce in Rep. Bot. Soc. Exch. Club Br. Isl. 1916: 621 (1917); Merr. in Contr. Gray Herb. 59: 19 (1919); Burtt Davy, Fl. Transv. 2:333 (1932); Henkel, Woody Pl. Natal 235 (1934); Ross, Fl. Natal 194 (1973); in Bothalia 11: 125 (1973). Syntypes: Natal, Durban [Port Natal], Drege (not traced); Cape Province, Bashee River, Drege (BM!; E!; K!; OXF!; P!; PRE!; TCD!).

Entada? natalensis Benth. in Hook., J. Bot. 4: 333 (1841); Benth. in Hook., Lond. J. Bot. 5: 78 (1846); Harv. in F.C. 2: 276 (1862); Benth. in Trans. Linn. Soc. Lond. 30: 364 (1875); Wood & Evans, Natal Plants 1: 33, t.39 (1898); Sim, For. Fl. Cape Col. 209 (1907). Syntypes as above. E. natalensis Benth. var. aculeata Harv. in F.C. 2: 276 (1862). Syntypes: Plant raised at Cape Town from Natal seeds, J. D. Watt (TCD!).

Adenopodia spicata (E. Mey.) Presl., Epimel. Bot. : 207 (1849). Syntypes as for Entada spicata.

Woody climber or scandent shrub up to 6 m high, usually armed with numerous scattered recurved prickles up to 5 mm long, sometimes unarmed; young branchlets densely puberulous or pubescent. Leaves sparingly to densely puberulous: petiole 3,5-9 cm long, unarmed or armed with recurved prickles, adaxial gland 0,7-1,5 mm long, often slightly raised or columnar, usually a short distance above the pulvinus, sometimes more than one gland present; rhachis 3,5-10,5(13,5) cm long, sulcate above, unarmed or armed with recurved prickles; pinnae 5-7 pairs; rhachillae 4-9 cm long; leaflets 7-12 pairs, 7,5-20(24) \times 2,5-7(9) mm, obliquely-oblong to obovateoblong, asymmetric basally, rounded or obtuse apically, sometimes slightly mucronate, sparingly to densely puberulous on both surfaces or sometimes \pm glabrous, sometimes with a conspicuous basal tuft of hairs to one side of the midrib on the lower

surface. Stipules linear, up to 6 mm long. soon deciduous. Inflorescences spicate, axillary, solitary or 2-3 together, usually forming a terminal panicle; spikes 1,5-4,5 cm long, axes sparingly to densely puberulous; peduncles 0,8-3 cm long. Flowers pale yellowishwhite, sessile. Calyx cupular, up to 1 mm long, very shortly 5-toothed or almost truncate, subglabrous to sparingly puberulous. Petals up to 2,75 mm long, united basally for ± 1 mm, glabrous. Stamens up to 6 mm long; anthers with an apical caducous gland. Ovary up to 1,5 mm long, densely villous, on a long stipe that elevates it above the corolla. *Pods* (5)8-13(16) \times (1,3) 1,8-3(3,7) cm, with a stipe up to 1,5 cm long, compressed, slightly curved to falcate, subcoriaceous, the valves splitting transversely into 1-seeded segments, sometimes one margin of the pod armed with recurved prickles. Seeds deep brown, \pm 7-10 \times 5-7 mm, smooth; areole \pm 5 \times 3 mm.

Found in the Transvaal, Swaziland, Natal and eastern Cape Province. Often forms dense impenetrable thickets on stream banks or on forest margins and in forest clearings.

TRANSVAAL.—2330 (Tzaneen): 14,4 km E. of Louis Trichardt, farm Rustfontein (—AA), Schlieben 7553; Duiwelskloof, Westfalia, eastern flank of Piesang Kop (—CA), Scheepers 958. 2430 (Pilgrim's Rest): Mariepskop, Blyde River picnic spot, Van der Schijff 7315. 2531 (Komatipoort): Barberton, Rogers 14012. 2730 (Vryheid): "Groothoek", Madhlangampisiberg, Wakkerstroom, Killick 3918. Grid ref. unknown: Blouberg, Smuts & Pole Evans 882.

SWAZILAND.—2631 (Mbabane): Grand Valley Hills, Compton 27444.

NATAL.—2732 (Ubombo): 3,2 km from Ingwavuma on Ndumu road, Ross 2348. 2830 (Dundee): road to Middledrift from Kranskop, Edwards 2730. 2831 (Nkandla): Nkandla forest, Edwards 2332. 2832 (Mtubatuba): Hluhluwe Game Reserve, Ward 1898. 2930 (Pietermaritzburg): Umgeni Valley, Nagle Dam road, Ross 962 (K, NU). 2931 (Stanger): Umdloti, Ross 485 (K, NU). 3030 (Port Shepstone): Uvongo, Strey 9439.

CAPE.—3129 (Port St. Johns): Ntafufu, Strey 8523. 3226 (Fort Beaufort): Douglasdale, near Seymour, Wells 3860. 3227 (Stutterheim): near Kei Road (—DA), Ranger 232; East London (—DD), Ragers 28098. 3228 (Butterworth): The Haven, J. L. Gordon-Gray 962 (GRA, NU), Grid ref. unknown: Pondoland, Bachmann 642, 645, 647a (Z).

E. spicata is the most widespread species of Entada in our area. There appears to be a tendency for an increase in the degree of pubescence of the lower leaflet surface towards the southern limit of distribution of the species.

Van der Schijff 3471, a sterile specimen with exceptionally large leaflets from the Pretorius Kop area of the Kruger National Park, is probably referable to E. spicata.

E. spicata is sometimes confused with Acacia kraussiana Meisn. ex Benth. but the two species may be readily distinguished. In A. kraussiana the flowers in round heads, the pods do not split transversely into segments, and the lowest pair of leaflets on each pinna are greatly reduced and bract-like.

The record of E. natalensis Benth. (i.e. E. spicata) by Sim, For. Fl. P.E. Afr. 53 (1909), needs confirmation. Although the description indicates E. spicata, the occurrence of this species in Mozambique has never been confirmed and it is thought that Sim was probably referring to E. schlechteri (Harms.) Harms. E. schlechteri, which is closely related to E. spicata, differs in having fewer pinnae pairs, broader leaflets and dark red flowers.
